Enterprise 3.0 Sizing Guide

Overview

Enterprise System sizing involves the process of determining how many resources are required to support a given workload.

As input in the sizing process we often have:

- The number of users
- A description or understanding of types and percentage of usage types (how many users are doing what)
- What frequency or how often users are interacting

As output in the sizing process we want to understand:

- The number of processors (CPUs) required to support a load
- The amount of memory required to support a load
- The appropriate configuration for a load type (number of services and where to put them)

The General assumption through this document is that each main service or component can be assessed independently through its capacity to respond to simultaneous requests from users in a time period with a certain amount of hardware resources (CPU and Memory)

Caution is advised when utilizing this document because the results derived are merely approximation based on the input data and the configuration of the system used by Business Objects. *It is recommended that you review the Base System Configure section to gage against your company's deployment hardware.*

Note:

This document addresses the sizing for general enterprise users only. It does not address the specific workflow of the following:

1. Federation
2. Publishing
3. Content Search

Please refer to the [3.0 Administrator Guide](#) for sizing and configuration.

For Query as a Web Service sizing information, a white paper will be available to address the specific deployment scenario.

It is recommend you review the [3.0 Administrator Guide](#) to fully understand the functional purpose of each server and service.
