Unit 3 Energy Changes and Rates of Reaction

CHAPTER 6 RATES OF REACTION

Answers to Learning Check Questions

(Student textbook page 357)

1. Measure the change in mass of the reactant, limestone, over a period of time or the amount of product, $\text{CO}_2(\text{g})$, generated over a period of time.
 2. It does not give information about the concentration of the reactants or products and does not indicate whether the reaction will proceed by itself or if additional energy will be required.
 3. Since the concentration increases from 0.25 mol/L to 0.420 mol/L, product was measured.
 4. The graph should show that the tangent is a line drawn between two points on a concentration vs. time graph that are brought closer and closer until they converge to one point in time. The instantaneous rate is calculated by measuring the slope of this tangent. This is done by determining the rise and the run and dividing the rise by the run. The rise is the change in concentration and the run is the change in time.
 5. **a.** A = 30; B = 10
b. The average rate of reaction can be determined using the number of molecules of A that are formed over a period of time. Draw a secant from $t = 0 \text{ s}$ to $t = 10 \text{ s}$ on either curve. The slope of this secant represents the average rate of change in the number of molecules of A and B, respectively.
c. The average rate of change in the number of molecules of A and of B is the same.
 6. The average rate. It represents how long the fruit could be left on the shelf. The instantaneous rate indicates how fast the fruit was spoiling at one point in time.
- (Student textbook page 367)*
7. The particles must collide with the proper orientation to one another and have sufficient kinetic energy to overcome the potential energy barrier between reactants and products.
 8. Many collisions have the wrong collision geometry, and only a fraction of the collisions are between particles with sufficient energy to overcome the potential energy barrier.
 9. The angle at which the reactants collide must be the same as the new bond will be when the products form.
 10. Diagrams for exothermic reactions show reactants with a higher potential energy than the potential energy for the products. Diagrams for endothermic reactions show reactants with a lower potential energy than that for the products.
 11. **a.** The minimum collision energy required for reaction between reactant particles.
