

Answers to Chapter 1

(in-text & asterisked problems)

Answer 1.1

No, this question is designed to assess whether you can derive simple information, make reasonable assumptions, and then apply it to a problem. We did not specify the probability of the monkeys or apes, or the characteristically whether they predominantly would do this or that type. We did not even specify which mark of Shakespeare. The important point is that even if you make reasonable, optimistic assumptions, the answer to the question is no.

Anthropologists with typed out the histories of the human species 1000 characters per second for a thousand years, would type out a thousand billion characters.

$$1000 \text{ years} \times \frac{365 \text{ days}}{\text{year}} \times \frac{24 \text{ hours}}{\text{day}} \times \frac{1000 \text{ characters}}{\text{hour}} = 8.76 \times 10^{10} \text{ characters}$$

$\approx 8.8 \times 10^{10}$ characters

Arguably, the shortest possible work of William Shakespeare would be the shortest name (for example "Al Shakespeare") is more 13 English letters, a space, and a period. However, there are over 1.8×10^{11} ways to combine 13 English letters, a space, and a period – a vast number that exceeds the number of ways for the prior monkeys. Even if we took each monkey's entire 80 documents from Shakespearean, the entire set would contain no more than 8.8×10^{10} 13-character combinations, so that, even with the optimistic assumptions, the odds are still too low against the monkeys.

Answer 1.2

- $10^{11} = 1.0 \times 10^{11} = 10^{11}$
- $10^{11} = 1 \text{ hundred} = 10^{11}$
- $10^{11} = 1 \text{ hundred billion} = 10^{11}$
- $10^{11} = 1.000000000 \times 10^{11}$

Answer 1.3

A DNA strand with 17 nucleotides has a potential diversity of $4^{17} = 1.8 \times 10^{10}$.
