- Be sure the hint reads: "The DNA molecule is complete."
If not, click **Reset** and build a new DNA molecule.

Question: How does DNA make a copy of itself?

1. **Observe:** An **enzyme** is a protein that facilitates certain cell processes. Drag the blue **DNA helicase** enzyme onto the DNA strand. What does this enzyme do to the DNA molecule?

2. **Observe:** Drag the yellow **DNA polymerase** molecule onto the DNA strand. DNA polymerase adds complementary nucleotides to create new double-stranded DNA molecules. Notice two groups of nucleotides on the right.

- A. Drag the correct nucleotide to the bottom of the left strand, where the DNA polymerase is located. What happens? _____

- B. Continue adding nucleotides to both strands. What happens to the DNA polymerase molecule each time you add a nucleotide? _____

- C. Complete the two DNA molecules. How do these molecules compare to each other? _____

3. **Compare:** Click the **camera** to take a snapshot of the DNA molecules, then paste the image into your document. Label this image "Daughter DNA molecules."

How do these molecules compare to the original? _____

Congratulations! You have completed the process of **replication**, where one "parent" DNA strand divides to form two identical "daughter" DNA strands.

4. **Think and discuss:** Why is DNA replication such an important process? _____

Halazonetis,2022-04-12 Abnormal DNA replication is the primary way that cancer develops in mammals therefore a deep understanding of the way replication works for healthy cells will enhance our ability to eradicate problematic replication pathways The same rapid advances in technology within the last ten to twenty years that have allowed us to understand DNA replication better have also led and will lead to new cancer therapies In recent years our understanding of the complexity of DNA replication has advanced tremendously This e book distills the bulk of the published studies in DNA replication with an intentional focus on eukaryotes specifically budding yeast and mammals An important feature of this e book is the incorporated images and figures Being able to clearly visualize protein and enzymatic processes is central to understanding them Therefore we have incorporated images of the three dimensional structures of the proteins that mediate DNA replication stepwise guides to simplify the complex nature of the replication process and cryo EM images for different proteins and protein DNA complexes to reveal their structural components We hope to have provided readers with both fundamentals and cutting edge information so that they may think about the biology of DNA replication and contribute to the body of knowledge in the field **DNA Replication** Arthur Kornberg,1974 **Recent Advances in DNA Replication** Tom Lee,2025-08-25 DNA replication is the biological process through which a cell creates an exact copy of its DNA It occurs in all living organisms to ensure the accurate transmission of genetic information It takes place during the S

phase of the cell cycle before cell division The process begins at specific locations called origins of replication where the DNA double helix is unwound by the enzyme helicase creating two single strands Each strand serves as a template for the formation of a new complementary strand facilitated by the enzyme DNA polymerase The result is two identical DNA molecules each containing one original and one newly synthesized strand ensuring genetic consistency in daughter cells DNA replication is crucial for growth development and tissue repair in multicellular organisms and for reproduction in single celled organisms This book presents the complex subject of DNA replication in the most comprehensible and easy to understand language The topics covered in this extensive book deal with the core topic of replication of DNA For all those who are interested in molecular and cellular biology this book can prove to be an essential guide
