How does masonry fail?

There are many ways in which masonry can fail. The most common is cracking, which can be caused by a variety of factors, including shrinkage, settlement, and thermal expansion and contraction. Cracking can be a cosmetic problem or it can be a structural one, depending on the location and extent of the crack. Other common problems include spalling, which is the loss of the surface layer of the masonry, and erosion, which is the loss of the masonry material itself. Both of these can be caused by weathering or by the use of poor quality materials.

It is important to identify the cause of the problem before attempting any repairs. If the problem is structural, it is essential to consult a structural engineer before proceeding. If the problem is cosmetic, it is still important to take the correct approach to the repairs, as this will ensure that the repairs last and that the appearance of the masonry is maintained.

The following sections of the guide provide detailed information on how to identify and repair different types of masonry damage. It also includes a section on the selection of materials and a section on the importance of matching the appearance of old work.
