Moreover, you find a detailed treatment of methods used to design security controls that not only meet individual corporate interests of a stakeholder but also work towards the holistic securing of the entire industry. This forward looking volume introduces exciting new areas of aviation security research and techniques for solving today's the most challenging problems such as security attack identification and response.

Detection of Explosives for Commercial Aviation Security National Research Council, Division on Engineering and Physical Sciences, National Materials Advisory Board, Commission on Engineering and Technical Systems, Committee on Commercial Aviation Security, 1993-01-01 This book advises the Federal Aeronautics Administration FAA on the detection of small concealed explosives that a terrorist could plant surreptitiously on a commercial airplane. The book identifies key issues for the FAA regarding explosive detection technology that can be implemented in airport terminals. Recommendations are made in the areas of systems engineering, testing and technology development. *Engineering Aviation Security Environments*-*"Reduction of False Alarms in Computed Tomography-Based Screening of Checked Baggage"* Committee on Engineering Aviation Security Environments-*"False Positives from Explosive Detection Systems"*, National Materials and Manufacturing Board, Division on Engineering and Physical Sciences, National Research Council, 2013-07-19 On November 19, 2001, the Transportation Security Administration (TSA) was created as a separate entity within the U.S. Department of Transportation through the Aviation and Transportation Security Act. The act also mandated that all checked baggage on U.S. flights be scanned by explosive detection systems (EDSs) for the presence of threats. These systems needed to be deployed quickly and universally but could not be made available everywhere. As a result, the TSA emphasized the procurement and installation of certified systems where EDSs were not yet available. Computer tomography (CT) based systems became the certified method or place holder for EDSs. CT systems cannot detect explosives but instead create images of potential threats that can be compared to criteria to determine if they are real threats. The TSA has placed a great emphasis on high level detections in order to slow false negatives or missed detections. As a result, there is abundance in false positives or false alarms. In order to get a better handle on these false positives, the National Research Council (NRC) was asked to examine the technology of current aviation security EDSs and false positives produced by this equipment. The ad hoc committee assigned to this task examined and evaluated the cases of false positives in the EDSs, assessed the impact of false positive resolution on personnel and resource allocation, and made recommendations on investigating false positives without increasing false

negatives To complete their task the committee held four meetings in which they observed security measures at the San Francisco International Airport heard from employees of DHS and the TSA Engineering Aviation Security Environments Reduction of False Alarms in Computed Tomography Based Screening of Checked Baggage is the result of the committee s investigation The report includes key conclusions and findings an overview of EDSs and recommendations made by the committee

Fusion of Security System Data to Improve Airport Security National Research Council, Division on Engineering and Physical Sciences, National Materials Advisory Board, Committee on Assessment of Security Technologies for Transportation, 2007-11-14 The security of the U S commercial aviation system has been a growing concern since the 1970 s when the hijacking of aircraft became a serious problem Over that period federal aviation officials have been searching for more effective ways for non invasive screening of passengers luggage and cargo to detect concealed explosives and weapons To assist in this effort the Transportation Security Administration TSA asked the NRC for a study of emerging screening technologies This book the fourth of four focuses on data fusion as a means to significantly improve the ability of the existing suite of airport detection systems and access control systems to detect and prevent attacks The book presents a discussion of the data fusion an analysis of current data fusion efforts and an assessment of data fusion opportunities for various airport security activities *FY71 Engineering Report on Surveillance Techniques for Civil Aviation Security* A. Aviation Security Frederick C. Dorey,1983 *The Practicality of Pulsed Fast Neutron Transmission Spectroscopy for Aviation Security* National Research Council,Division on Engineering and Physical Sciences,National Materials Advisory Board,Commission on Engineering and Technical Systems,Panel on Assessment of the Practicality of Pulsed Fast Neutron Transmission Spectroscopy for Aviation Security,1999-05-07 A major goal of the Federal Aviation Administration FAA and now the Transportation Security Administration TSA is the development of technologies for detecting explosives and illegal drugs in freight cargo and passenger luggage One such technology is pulsed fast neutron analysis PFNA This technology is based on detection of signature radiation gamma rays induced in material scanned by a beam of neutrons While PFNA may have the potential to meet TSA goals it has many limitations Because of these issues the government asked the National Research Council to evaluate the potential of PFNA for airport use and compare it with current and future x ray technology The results of this survey are presented in Assessment of the Practicality of Pulsed Fast Neutron Analysis for Aviation Security A broad range of detection methods and test results are covered in this report Tests conducted as of October 2000 showed that the PFNA system was unable to meet the stringent federal aviation requirements for explosive detection in air cargo containers PFNA systems did however demonstrate some superior characteristics compared to existing x ray systems in detecting explosives in cargo containers though neither system performed entirely satisfactorily Substantial improvements are needed in the PFNA detection algorithms to allow it to meet aviation detection standards for explosives in cargo and passenger baggage The PFNA system currently requires a long scan time an average of 90 minutes per container in the prototype testing in October 2000 needs considerable radiation shielding is significantly larger than current x ray systems and has high implementation costs These factors are likely to limit installation at airports even if the detection capability is improved Nevertheless because PFNA has the best potential of any known technology for detecting explosives in cargo and luggage this book discusses how continued research to improve detection capabilities and system design can best be applied for the airport environment

and Assessing Aviation Security explains how standard risk analytic and cost benefit analysis can be applied to aviation security in systematic and easy to understand steps The book evaluates and puts into sensible context the risks associated with air travel the risk appetite of airlines and regulators and the notion of acceptable risk It does so by describing the effectiveness risk reduction and cost of each layer of aviation security from policing and intelligence to checkpoint passenger screening to arming pilots on the flight deck Quantifies the risks costs and benefits of various aviation security methods including policing intelligence PreCheck checkpoint passenger screening behavioral detection air marshals and armed pilots Focuses on security measures that reduce costs without reducing security including PreCheck Federal Flight Deck Officer program and Installed Physical Secondary Barriers Features risk reduction insights with global applications that are fully transparent and fully explored through sensitivity analysis

Airline Passenger Security Screening Committee on Commercial Aviation Security, Panel on Passenger Screening, Commission on Engineering and Technical Systems, National Materials Advisory Board, Division on Engineering and Physical Sciences, National Research Council, 1996-07-03 This book addresses new technologies being considered by the Federal Aviation Administration FAA for screening airport passengers for concealed weapons and explosives The FAA is supporting the development of promising new technologies that can reveal the presence not only of metal based weapons as with current screening technologies but also detect plastic explosives and other non metallic threat materials and objects and is concerned that these new technologies may not be appropriate for use in airports for other than technical reasons This book presents discussion of the health legal and public acceptance issues that are likely to be raised regarding implementation of improvements in the current electromagnetic screening technologies implementation of screening systems that detect traces of explosive materials on passengers and implementation of systems that generate images of passengers beneath their clothes for analysis by human screeners
