NAME: _____ DATE: _____ PERIOD: _____

Background:

A mole is Avogadro's number of representative particles. Amedeo Avogadro determined that 6.02×10^{23} particles of any substance would equal 1 mole of that substance. The appropriate name for a representative particle is determined by the identity of the substance. A substance that is **ionic** (**metal-nonmetal**) would be appropriately named as **formula units**. A substance that is **molecular** (**nonmetal-nonmetal**) would be termed **molecules** and a substance that is an **element** would be labeled **atoms**. This number is too large to count so chemists use the concept of the mole to calculate the number of particles by obtaining the mass of the substance. This idea is referred to as "counting by weighing".

Grams → Moles → Representative Particles

Procedure:

- 1) From the front board, write down the average mass of an empty petri dish.
- 2) Go to each station and pick up the sample bottle with contents. Do not open the petri dish! Using a balance, obtain the mass of the petri dish and contents.
- 3) Using information written on the container label, fill in the data table below.

Data:

Sample Number	Chemical Formula	Chemical Name of Substance	Mass of empty petri dish	Mass of substance and petri dish

Give the number of the petri dish that contains a substance that would be used in each situation.
