

MATLAB's standard solver for ordinary differential equations (ODE's) is the function `ode45`. This function implements a Runge-Kutta method with a variable time step for efficient computations. `ode45` is designed to handle the following general problem:

$$\frac{dy}{dt} = f(t, y) \quad y(t_0) = y_0 \quad [1]$$

where t is the independent variable (time, position, volume) and y is a vector of dependent variables (parameters, positions, concentrations) to be found. The mathematical problem is specified where the vector of functions on the right-hand side of Eq. [1], $f(t, y)$, is set and the initial conditions, $y = y_0$, at time t_0 , are specified.

This note here apply to versions of MATLAB older than 5.0 and advise the format of using the function `ode45`. For more information on this and other ODE solvers in MATLAB, see the on-line help.
