**ELECTRONICS AND SOLID STATE DEVICES (B.SC III)** LALIT MOHAN GARG, 2023-03-10      Modulation Theory Marcelo Sampaio de Alencar, 2022-09-01 In recent years a considerable amount of effort has been devoted both in industry and academia towards the design performance analysis and evaluation of modulation schemes to be used in wireless and optical networks towards the

development of the next and future generations of mobile cellular communication systems Modulation Theory is intended to serve as a complementary textbook for courses dealing with Modulation Theory or Communication Systems but also as a professional book for engineers who need to update their knowledge in the communications area The modulation aspects presented in the book use modern concepts of stochastic processes such as autocorrelation and power spectrum density which are novel for undergraduate texts or professional books and provides a general approach for the theory with real life results applied to professional design This text is suitable for the undergraduate as well as the initial graduate levels of Electrical Engineering courses and is useful for the professional who wants to review or get acquainted with the a modern exposition of the modulation theory The books covers signal representations for most known waveforms Fourier analysis and presents an introduction to Fourier transform and signal spectrum including the concepts of convolution autocorrelation and power spectral density for deterministic signals It introduces the concepts of probability random variables and stochastic processes including autocorrelation cross correlation power spectral and cross spectral densities for random signals and their applications to the analysis of linear systems This chapter also includes the response of specific non linear systems such as power amplifiers The book presents amplitude modulation with random signals including analog and digital signals and discusses performance evaluation methods presents quadrature amplitude modulation using random signals Several modulation schemes are discussed including SSB QAM ISB C QUAM QPSK and MSK Their autocorrelation and power spectrum densities are computed A thorough discussion on angle modulation with random modulating signals along with frequency and phase modulation and orthogonal frequency division multiplexing is provided Their power spectrum densities are computed using the Wiener Khintchin theorem

**Communication Theory** Dr. J. S. Chitode, 2021-01-01 Amplitude modulation and Angle modulation are discussed in first two chapters AM FM analysis equations modulators detectors transmission and reception are thoroughly presented SSB DSB VSB FDM are also discussed Noise theory is given in third chapter It includes random variables probability random processes and correlation functions Noise factor noise temperature and mathematical analysis of noise is presented Performance of modulation systems in the presence of noise is explained in fourth chapter Figure of merit capture effect and threshold effect are also presented Last chapter presents information theory Entropy information rate discrete memoryless source source coding Shannon's theorems are also given in detail Mutual information and channel capacity are also presented

*Principles of Communication Engineering* A.K.Chhabra, 2006 The first four chapters of the text describe different types of signals modulation and demodulation of these signals various transmission channels and noise encountered by the signals during propagation from sender to receiver end Apart from this this part of the book also deals with different forms of line communication systems A brief introduction of information theory is also given at the end of the text so that the students become familiar with this aspect of communication systems
