Research Libraries,1978 **Clinical Applications of Synthetic MRI of the Brain** Ida Blystad,2017-11-16 Magnetic Resonance Imaging MRI has a high soft tissue contrast with a high sensitivity for detecting pathological changes in the brain Conventional MRI is a time consuming method with multiple scans that relies on the visual assessment of the neuroradiologist Synthetic MRI uses one scan to produce conventional images but also quantitative maps based on relaxometry that can be used to quantitatively analyse tissue properties and pathological changes The studies presented here apply the use of synthetic MRI of the brain in different clinical settings In the first study synthetic MR images were compared to conventional MR images in 22 patients The contrast the contrast to noise ratio and the diagnostic quality were assessed Image quality was perceived to be inferior in the synthetic images but synthetic images agreed with the clinical diagnoses to the same extent as the conventional images Patients with early multiple sclerosis were analysed in the second study In patients with multiple sclerosis contrast enhancing white matter lesions are a sign of active disease and can indicate a need for a change in therapy Gadolinium based contrast agents are used to detect active lesions but concern has

been raised regarding the long term effects of repeated use of gadolinium In this study relaxometry was used to evaluate whether pre contrast injection tissue relaxation rates and proton density can identify active lesions without gadolinium The findings suggest that active lesions often have relaxation times and proton density that differ from non enhancing lesions but with some overlap This makes it difficult to replace gadolinium based contrast agent injection with synthetic MRI in the monitoring of MS patients Malignant gliomas are primary brain tumours with contrast enhancement due to a defective blood brain barrier However they also grow in an infiltrative diffuse manner making it difficult to clearly delineate them from surrounding normal brain tissue in the diagnostic workup at surgery and during follow up The contrast enhancing part of the tumour is easily visualised but not the diffuse infiltration In studies three and four synthetic MRI was used to analyse the peritumoral area of malignant gliomas and revealed quantitative findings regarding peritumoral relaxation changes and non visible contrast enhancement suggestive of non visible infiltrative tumour growth In conclusion synthetic MRI provides quantitative information about the brain tissue and this could improve the diagnosis and treatment for patients
