Database System Concepts Abraham Silberschatz, Henry F. Korth, S. Sudarshan, 2011 **eBook: Database Systems Concepts 6e** SILBERSCHATZ, 2010-06-16 eBook Database Systems Concepts 6e **Loose Leaf for Database System Concepts** Henry F. Korth, S. Sudarshan, Abraham Silberschatz, Professor, 2019-03-01 Database System Concepts by Silberschatz Korth and Sudarshan is now in its 7th edition and is one of the cornerstone texts of database education. It presents the fundamental concepts of database management in an intuitive manner geared toward allowing students to begin working with databases as quickly as possible. The text is designed for a first course in databases at the junior senior undergraduate level or the first year graduate level. It also contains additional material that can be used as supplements or as introductory material for an advanced course. Because the authors present concepts as intuitive descriptions, a familiarity with basic data structures, computer organization, and a high-level programming language are the only prerequisites. Important theoretical results are covered, but formal proofs are omitted. In place of proofs, figures and examples are used to suggest why a result is true.

Readings in Database Systems Joseph M. Hellerstein, Michael Stonebraker, 2005. The latest edition of a popular text and reference on database research with substantial new material and revision covers classical literature and recent hot topics. Lessons from database research have been applied in academic fields ranging from bioinformatics to next-generation Internet architecture and in industrial uses including Web-based e-commerce and search engines. The core ideas in the field have become increasingly influential. This text provides both students and professionals with a grounding in database research and a technical context for understanding recent innovations in the field. The readings included treat the most important issues in the database area, the basic material for any DBMS professional. This fourth edition has been substantially updated and revised with 21 of the 48 papers new to the edition; four of them published for the first time. Many of the sections have been newly organized, and each section includes a new or substantially revised introduction that discusses the context, motivation, and controversies in a particular area, placing it in the broader perspective of database research. Two introductory articles, never before published, provide an organized current introduction to basic knowledge of the field: one discusses the history of data models and query languages, and the other offers an architectural overview of a database system. The remaining articles range from the classical literature on database research to treatments of current hot topics, including a paper on search engine architecture and a paper on application servers, both written expressly for this edition. The result is a collection of papers that are seminal and also accessible to a reader who has a basic familiarity with database systems.

Database Management System (DBMS) A Practical Approach Rajiv Chopra, 2010. Many books on Database Management Systems (DBMS) are available in the market; they are incomplete, very formal, and dry. Stream Data Processing: A Quality of Service Perspective Sharma Chakravarthy, Qingchun Jiang, 2009-04-09 In recent years a new class of applications has come to the forefront primarily due to the advancement in our ability to collect data from multitudes of devices and process them efficiently These include homeland security applications sensor pervasive computing applications various kinds of monitoring applications and even traditional applications belonging to financial computer network management and telecommunication domains These applications need to process data continuously and as long as data is available from one or more sources The sequence of data items continuously generated by sources is termed a data stream Because of the possible never ending nature of a data stream the amount of data to be processed is likely to be unbounded In addition timely detection of interesting changes or patterns or aggregations over incoming data is critical for many of these applications Furthermore the data arrival rates may fluctuate over a period of time and may be bursty at times For most of these applications Quality of Service or QoS requirements such as response time memory usage and throughput are extremely important These application requirements make it infeasible to simply load the incoming data streams into a persistent store and process them efficiently using currently available database management techniques
