

1 THE CARDIOVASCULAR SYSTEM

The major regions of the cardiovascular system, the heart and blood vessels, play a vital role in human physiology. The major function of the cardiovascular system is transportation. It takes blood to the various cells of the body, carries oxygen, glucose, amino acids, antibodies, and wastes, and carries carbon dioxide to and from body cells. It transports blood to the contracting heart.

The anatomy and location of the heart and blood vessels and the important subdivisions of cardiovascular physiology (the chambers, cardiac cycle, myocardium, etc.) and regulation of blood pressure are the major topics of this chapter.
