

CIRCUIT ANALYSIS

CIRCUITS

There are a number of tools you can use for very small electrical circuits. For example, given a small electrical circuit you can do any or all of the following.

- Look for resistor combinations - either series or parallel.
- Look for sources that you can find a Thevenin or Norton equivalent for.
- Look for embedded voltage dividers.
- Hope that all of the above will lead to a very simple circuit that you can analyze.

But . . . what happens when you do all of that and you still can't figure out what goes on?

- You need some general method that you know will get you to a result.

In other words, what you may need is a method that has a high probability of success - one that is almost guaranteed to work for a large variety of circuits. There are two general methods you might try in that situation:

- The method of node voltages.
- The loop equation method.

Node Voltage Equations

- The method of Node Voltages starts with writing the KCL equations for the nodes in a circuit. Those equations are written in terms of node voltages (even though you are writing the Current Law, the variables are voltages!) thus the name!

That's a little simplified, but that is the essence of the method. We'll start with a simple circuit, and we will try to discover what you have to do. Here's a very simple circuit. It is a voltage divider. We notice some very simple facts about this circuit.

- There are two nodes in this circuit. One is marked with a

red dot, the other is marked with an green dot.

- There is a difference between the two nodes. If we know V_s - the source voltage - then we know the voltage at the node marked with an green dot.
- We don't know the voltage at the node marked with a red dot unless we do some analysis.

Now, what we are really saying about this circuit is the following.

- Since there is only one node where we do not know the voltage, when we write the equations for this circuit, we really only need one equation.
- There's one unknown and there's going to be one equation.
- The equation we need to write is KCL at the node with the unknown voltage.

Now, we will write the equation at the node with the unknown voltage.

- We need to define a symbol for the unknown voltage. We'll call it V_x .
- Then we write KCL at the node where V_x appears.
- Finally, we solve whatever equation results from writing KCL.

Now, we will write the equation at the node with the unknown voltage.

- To write KCL we need to define two currents for this case. They are shown below.

Circuit Analysis Speedy Study Guide:

Circuit Analysis (Speedy Study Guide) Speedy Publishing, 2014-12-07 Electrical wiring and circuitry can be a very exacting undertaking with the great potential for negative results occurring if a circuit's connections are off by even one space. A circuit analysis guide provides a breakdown of every possible symbol and mechanism within a circuit diagram in order to educate electricians, engineers, and so on about the proper ways to align a circuit and what common symbols to pay extra focus upon. Studying it and class texts should lead to excellence.
