2. How does the circulatory system work with other systems?

What is it?

The circulatory system is a network of blood vessels that transport blood throughout the body. It is responsible for delivering oxygen and nutrients to the cells and removing waste products. The system is divided into two main parts: the pulmonary circulation, which carries blood between the heart and the lungs, and the systemic circulation, which carries blood between the heart and the rest of the body.

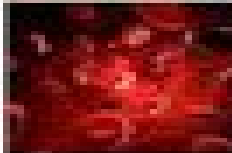

How it works

The heart is the central pump of the circulatory system. It has four chambers: the right atrium, the right ventricle, the left atrium, and the left ventricle. The right side of the heart pumps blood to the lungs, and the left side pumps blood to the rest of the body. The blood flows in a continuous loop, returning to the heart after each trip.
