Magnetic Circuit Design and Analysis using Finite Element Method

3.1 Introduction

In general, the Finite Element Method (FEM) models a structure as an assemblage of small parts (elements). Each element is of simple geometry and therefore is much easier to analyze than the actual structure. In essence, a complicated solution is approximated by a model that consists of piecewise continuous simple solutions. Elements are called 'finite' to distinguish them from differential elements used in calculus. Discretization is accomplished simply by sawing the continuum into pieces and then pinning the pieces together again at node points [15]. FEM is a better solution for electromagnetic circuit design for permanent magnet machines [16-23]. Partial Differential Equation (PDE) toolbox of Matlab is used for the design of topologies and for getting FEM solution for electromagnetic problems using magnetostatic application.

Design of PMH stepper motor magnetic circuit using equivalent circuit model is difficult due to double slotting structure, presence of permanent magnet in the rotor and saturation effects. Hybrid stepper motor has a large number of teeth on the stator and rotor surface and a very small air gap; the magnetic saturation in the teeth becomes severe while increasing the flux density in the airgap. In addition, both radial flux and axial flux are produced because of axially magnetized permanent magnet and geometric characteristics [24]. This makes the analysis of hybrid stepper motor more difficult using two dimensional (2-D) modeling FEM. Three dimensional finite element analysis is one of the solution for nonlinear analysis of axially unsymmetrical hybrid stepper motor under this situation [25]. But in order to reduce the
