for Circuit Theory and Electronic Devices is one of a series of five PSpice books and introduces the latest Cadence Orcad  
PSpice version 10.5 by simulating a range of DC and AC exercises It is aimed primarily at those wishing to get up to speed  
with this version but will be of use to high school students undergraduate students and of course lecturers Circuit theorems  
are applied to a range of circuits and the calculations by hand after analysis are then compared to the simulated results The  
Laplace transform and the s plane are used to analyze CR and LR circuits where transient signals are involved Here the  
Probe output graphs demonstrate what a great learning tool PSpice is by providing the reader with a visual verification of  
any theoretical calculations Series and parallel tuned resonant circuits are investigated where the difficult concepts of  
dynamic impedance and selectivity are best understood by sweeping different circuit parameters through a range of values  
Obtaining semiconductor device characteristics as a laboratory exercise has fallen out of favour of late but nevertheless is  
still a useful exercise for understanding or modelling semiconductor devices Inverting and non inverting operational  
amplifiers characteristics such as gain bandwidth are investigated and we will see the dependency of bandwidth on the gain  
using the performance analysis facility Power amplifiers are examined where PSpice Probe demonstrates very nicely the  
problems of cross over distortion and other problems associated with power transistors We examine power supplies and the  
problems of regulation ground bounce and power factor correction Lastly we look at MOSFET device characteristics and  
show how these devices are used to form basic CMOS logic gates such as NAND and NOR gates      *Dynamo Laboratory
