

Lesson 10: Acceleration

Acceleration is a vector which measures the change in the velocity of an object.

- Don't forget that velocity is a vector, so it has **magnitude** and **direction**.
- This means acceleration could be any of the following three...
 1. **a change in speed**, the magnitude of the velocity (from 34 km/h to 67 km/h)
 2. **a change in direction** (from East to North-East)
 3. **a change in both speed and direction** (from 34 km/h East to 12 km/h West)

Acceleration is a measure of the rate at which velocity changes.

- Since velocity is a measure of the rate of change in displacement and had the equation...

$$v = \frac{d}{t}$$

- the equation for acceleration should be similar, since it is a rate of change in velocity...

$$a = \frac{\Delta v}{t}$$

a = acceleration (m/s/s or just m/s²)

Δv = change in velocity (m/s)

Δt = time interval (s)

- For day to day use this formula is usually expanded to show that the change in velocity means final minus initial.

$$a = \frac{v_f - v_i}{t}$$

Notice the units for acceleration.

- Since we take velocity and divide by time, we would get (without any simplification) m/s/s for units.
- What this really means is that for every second that passes the velocity of the object will change by this many metres per second.
- To make it a bit easier to read we use a little math to get m/s² for the units.

Example 1: A car moving at 50km/h accelerates to 60km/h in 7.0 seconds. **Determine** its acceleration.

We first need to change the velocities from km/h into m/s:

$$50 \text{ km/h} = 13.88888889 \text{ m/s}$$

$$60 \text{ km/h} = 16.66666666 \text{ m/s}$$

Now we use the formula.

Warning!

Keep the actual 13.88888889 that you see on your calculator for your calculations... never round off until the end of a problem!! You do need to keep in mind that the original number only had 2 sig digs.
