

## Chapter 12: Liquids, Solids, and Intermolecular Forces

Why are some substances solids, while others are liquids or gases at room temperature and pressure (25°C, 1 atm)?

The different physical states of matter (SOLID, LIQUID, GAS) exist primarily because of differences in **INTERMOLECULAR FORCES** that act between particles of these substances.

Substances that are **GASES** at room temp. and pressure:

- Have **very weak** intermolecular interactions
- Have particles that are **far apart**
  - The particles have complete freedom from each other
- Have **low density** compared to liquids and solids
- Expand to fill their container
  - The particles are constantly flying around, bumping into each other and their container
- Can be **easily compressed** into a smaller volume
- **Are fluid** - exhibits a smooth, continuous flow as it moves
- Are either **monoatomic atoms** (He, Ne) or are **molecules with covalent bonding**

**Chemical, Biochemical, and Engineering Thermodynamics** Stanley I. Sandler, 2017-04-24 In this newly revised 5th Edition of Chemical and Engineering Thermodynamics Sandler presents a modern applied approach to chemical thermodynamics and provides sufficient detail to develop a solid understanding of the key principles in the field The text confronts current information on environmental and safety issues and how chemical engineering principles apply in biochemical engineering bio technology polymers and solid state processing This book is appropriate for the undergraduate and graduate level courses

*Instrumentation and Sensors for the Food Industry* E Kress-Rogers, C J B Brimelow, 2001-10-03 The first edition of this book quickly established itself as the standard reference in its field and the second edition consolidates this reputation Keeping up with the rapid change in this area there are 16 new contributors and 8 completely new chapters as well as major revisions to existing chapters making this second edition a substantially longer book Instrumentation and sensors for the food industry 2nd edition begins with two introductory chapters to set the scene part one covers in line measurement of food processing operations including colour measurement the measurement of food composition by a range of techniques and the measurement of pressure temperature level flow and viscosity Part two reviews instrumental techniques in the quality control laboratory including the measurement of rheological properties texture water and microbiological activity Part three has five chapters devoted to the increasingly widespread use of electronic noses chemosensors biosensors immunosensors and DNA probes Comprehensively revised and expanded edition of a standard work in its field Authoritative and practical guide to the range of instrumentation and sensors available Written by a distinguished international panel of experts

**Applications of Calorimetry in a Wide Context** Amal Ali Elkordy, 2013-01-23 Calorimetry as a technique for thermal analysis has a wide range of applications which are not only limited to studying the thermal characterisation e g melting temperature denaturation temperature and enthalpy change of small and large drug molecules but are also extended to characterisation of fuel metals and oils Differential Scanning Calorimetry is used to study the thermal behaviours of drug molecules and excipients by measuring the differential heat flow needed to maintain the temperature difference between the sample and reference cells equal to zero upon heating at a controlled programmed rate Microcalorimetry is used to study the thermal transition and folding of biological macromolecules in dilute solutions Microcalorimetry is applied in formulation and stabilisation of therapeutic proteins This book presents research from all over the world on the applications of calorimetry on both solid and liquid states of materials

Phase Equilibria in Chemical Engineering Stanley M. Walas, 2013-10-22 Phase Equilibria in Chemical Engineering is devoted to the thermodynamic basis and practical aspects of the calculation of equilibrium conditions of multiple phases that are pertinent to chemical engineering processes Efforts have been made throughout the book to provide guidance to

adequate theory and practice The book begins with a long chapter on equations of state since it is intimately bound up with the development of thermodynamics Following material on basic thermodynamics and nonidealities in terms of fugacities and activities individual chapters are devoted to equilibria primarily between pairs of phases A few topics that do not fit into these categories and for which the state of the art is not yet developed quantitatively have been relegated to a separate chapter The chapter on chemical equilibria is pertinent since many processes involve simultaneous chemical and phase equilibria Also included are chapters on the evaluation of enthalpy and entropy changes of nonideal substances and mixtures and on experimental methods This book is intended as a reference and self study as well as a textbook either for full courses in phase equilibria or as a supplement to related courses in the chemical engineering curriculum Practicing engineers concerned with separation technology and process design also may find the book useful
