

SUGGESTED ANSWERS

- (d); Choice (d) is correct. A ray passing through the optical centre of a converging lens does not undergo refraction. It continues on a straight path through the lens. Choice (a) is incorrect. A ray passing through the secondary principal focus is refracted by the lens so that it emerges parallel to the principal axis. Choice (b) is also incorrect. A ray parallel to the principal axis is refracted by the lens and passes through the principal focus. Choice (c) is incorrect. A light ray that strikes a retro-reflector is reflected back in the same direction from which it came.
- (b); Choice (b) is correct. A compound microscope produces two images. An inverted, real image that is larger than the object is produced inside the body of the microscope. A larger, inverted, virtual image is the image you actually see when you look at an object through a compound microscope. Choices (a), (c), and (d) are all incorrect. They all describe images that are not produced by a compound microscope.
- (b); Choice (b) is correct. An object placed at $2F'$ produces an inverted, real image that is the same size as the object. Choice (a) is incorrect. An object placed at F' does not produce an image because the refracted rays are parallel to one another. Choice (c) is incorrect. An object placed beyond $2F'$ produces an inverted, real image that is smaller than the object. Choice (d) is incorrect. An object placed between $2F'$ and F' produces an inverted, real image that is larger than the object.
- (d); Choice (d) is correct. If you substitute 1 for M into the magnification equation, $M = (h_i / h_o)$, you will see that the values for h_i and h_o must be equal to each other. Choice (a) is incorrect. If a lens has a magnification of 1.0, the lens will still produce an image, but the image will be the same size as the original object. Choices (b) and (c) are also incorrect. According to the magnification equation, $M = (h_i / h_o)$, if $M = 1$, the height of the object, h_o , and the height of the image, h_i , must be the same.
- False. When light rays strike a converging lens, they are refracted by the lens. The lens then brings these refracted rays together to form an image. A true version of the statement would be: A converging lens produces an image by refracting light rays that strike the lens, then bringing the refracted rays together at a single point.
- True. To use the thin lens equation correctly, you should always express the distance from the object to the optical centre of the lens as a positive number.
- diverging; When light rays from an object strike a diverging lens, they are refracted by the lens and spread apart. The viewer's brain extends the diverging rays backward to form a virtual image that is on the same side of the lens as the object.
- virtual; A magnifying glass is a converging lens that does not produce a real image. Light rays from an object strike the lens and diverge, but the human brain extends the rays backward to produce an enlarged, virtual image on the same side of the lens as the object.
- accommodation; The muscles in a healthy eye can change the shape of the eye lens, allowing the eye to focus on distant and nearby objects.
- (a)(iv) Light rays parallel to the principal axis are refracted by the lens and converge at a point on the principal axis on the opposite side of the lens; this point of convergence is the principal focus; (b)(i) The optical centre is the centre of the lens; (c)(iii) The principal axis is a horizontal line that passes through the optical centre and is perpendicular to the vertical line that passes through the centre of the lens; (d)(ii) The secondary principal focus is a point on the principal axis located on the same side of the lens relative to the incident ray.
- It is possible to position an object in front of a converging lens so that no image is produced. An object placed at the secondary principal focus will not produce a real image because the emergent rays are parallel. However, placing an object between the lens and the secondary principal focus will produce a virtual image—this is another example where no real image is produced.
