

Chapter 17: Gene Expression: From Gene to Protein

- 17.1 Describe evidence that helped us understand the process of gene expression, and describe the process.*
- 17.2 Explain transcription, including a description of important molecules involved in the process.*
- 17.3 Trace the steps involved in eukaryotic RNA processing.*
- 17.4 List the cellular components and molecules involved in translation, and describe the process, then describe how multiple polypeptides are made in bacteria and eukaryotes.*
- 17.5 Identify different types of mutations and how they can affect protein structure and function, and then discuss the concept of a gene.*

This important chapter may be a very long journey, but it is crucial to your understanding of biology. Work on this chapter a single concept at a time and allow plenty of time to truly master the material. It is likely that you are familiar with the basics of protein synthesis from an earlier biology class, but now we will add details to help you understand the larger picture. Many important ideas are found in this chapter, which explains how the genetic code is translated to proteins, and ways that process is regulated. Good luck and take your time.

Study Tip: Recreate the diagram under “Make a visual study guide” on p.335 and label all the arrows the following: transcription, RNA processing, and translation. Know these terms. Be sure to separate these terms from replication, studied in the last chapter. Together, the four terms represent the core of molecular biology.

_____ are the link between genotype and phenotype.

Concept 17.1 Genes specify proteins via transcription and translation

LO 17.1: Describe evidence that helped us understand the process of gene expression, and describe the process.
