Recoding: Expansion of Decoding Rules Enriches Gene Expression John F. Atkins,Raymond F. Gesteland,2010-03-10 The literature on recoding is scattered so this superb book lls a need by prov ing up to date comprehensive authoritative reviews of the many kinds of recoding phenomena Between 1961 and 1966 my colleagues and I deciphered the genetic code in Escherichia coli and showed that the genetic code is the same in E coli Xenopus laevis and guinea pig tissues These results showed that the code has been c served during evolution and strongly suggested that the code appeared very early during biological evolution that all forms of life on earth descended from a c

mon ancestor and thus that all forms of life on this planet are related to one another The problem of biological time was solved by encoding information in DNA and retrieving the information for each new generation for it is easier to make a new organism than it is to repair an aging malfunctioning one Subsequently small modifications of the standard genetic code were found in certain organisms and in mitochondria Mitochondrial DNA only encodes about 10-13 proteins so some modifications of the genetic code are tolerated that probably would be lethal if applied to the thousands of kinds of proteins encoded by genomic DNA *Recoding: Expansion of Decoding Rules Enriches Gene Expression* John F. Structural Basis for mRNA and tRNA Positioning on the Ribosome Veysel Berk, 2007 **Structural Insights Into Decoding of mRNA by the Ribosome**, 2008 **Insights Into the Decoding Mechanism from Studies of Mutant Ribosomes** Sean P. McClory, 2013 Abstract In all cells the 2.5 MDa two subunit complex known as the ribosome is responsible for translating each messenger RNA (mRNA) into a functional protein To do so the ribosome must correctly select the cognate aminoacyl tRNA (aa-tRNA) specified by each three nucleotide codon in the mRNA's coding sequence and incorporate the attached amino acid into the peptide chain The accuracy of this process is critical for cellular function many potent antimicrobial agents act by promoting errors in aa-tRNA selection and even moderate defects in translation fidelity contribute to several disease states in higher eukaryotes *Mechanisms Controlling mRNA Processing and Translation: Decoding the Regulatory Layers Defining Gene Expression Through RNA Sequencing*, 2015 *Dynamic Decoding of RNA* Junhong Choi, 2019 Genetic information encoded in messenger RNA (mRNA) is translated by the ribosome a molecular machine that maps RNA to protein sequences following the genetic code Translation of mRNA is regulated to control location abundance sequence and structure of the synthesized protein within the cell Such regulation often involves pausing translation at a specific location within the mRNA which may result in the local redefinition of the genetic code and synthesis of different protein products In this dissertation we investigate distinct pausing events involving actively translating

ribosomes observed using single molecule fluorescence spectroscopy We particularly focus on the translational pauses induced by the chemical modification of RNA the formation of stable RNA secondary structure and the nascent protein sequences and how these lead to local redefinition of the genetic code Finally we discuss extension of the current experimental platform to understand how RNA elements induce pausing of different molecular machineries such as human immunodeficiency virus HIV reverse transcriptase serving distinct roles in regulating RNA based information transfer processes within the cell
