

CHAPTER 15 SOUND PHYSICS

SOUND WAVES AND ITS PRODUCTION

All sounds are caused by something called vibrating.

Vibration sources cause the air around to vibrate. These vibrations are passed through the air to our ears where the eardrum to vibrate and we hear sound.

The vibrations are forward and backward about a fixed position, producing regions of compressions(C) and rarefactions(R) in an Alternate Manner.

NOTE

Sound travels through space in longitudinal waves. When an object vibrates in air (for example, a guitar string), it pushes against surrounding gas molecules at regular intervals. These alternating regions of dense air (called **compressions**) and less dense air (called **rarefactions**) create sound waves. As these waves travel, they bounce off or are absorbed by objects in their path. When they reach our ears, we perceive them as sound. Sound can travel through **gases, liquids, and solids**.

examples of objects that make uses of vibrations for their operations are:
