

RNA Synthesis

For Questions 4–10, complete each statement by writing the correct word or words.

3. The process of using DNA to produce complementary RNA molecules is called **transcription**.
4. The sequence of **transcribed** in mRNA complements the sequence in the DNA template.
5. In eukaryotes, RNA is formed in the **cell's nucleus** and then travels to the **cytoplasm**.
6. The enzyme **RNA polymerase** binds to DNA during transcription.
7. RNA polymerase binds to regions of DNA called **promoters**, which are “start” signals for transcription.
8. **introns** are portions of RNA that are cut out and discarded.
9. **exons** are spliced together to make the final mRNA.

13.2 Ribosomes and Protein Synthesis

Lesson Objectives

Identify the genetic code and explain how it is read.

Summarize the process of translation.

Describe the “central dogma” of molecular biology.

Lesson Summary

The Genetic Code A specific sequence of bases in DNA carries the directions for forming a **polypeptide**, a chain of amino acids. The types and order of amino acids in a polypeptide determine the properties of the protein. The sequence of bases in mRNA is the **genetic code**. The four bases, A, C, G, and U, act as “letters.”

3. The code is read three “letters” at a time, so that each “word” is three bases long and corresponds to a single amino acid. Each three-letter “word” in mRNA is known as a **codon**.

Some codons serve as “start” and “stop” signals for protein synthesis.

Translation Ribosomes use the sequence of codons in mRNA to assemble amino acids into polypeptide chains. The process of decoding of an mRNA message into a protein is **translation**.

Messenger RNA is transcribed in the nucleus and then enters the cytoplasm.

4. On the ribosome, translation begins at the start codon. Each codon attracts an **anticodon**, the complementary sequence of bases on tRNA.
5. Each tRNA carries one kind of amino acid. The match between the codon and anticodon ensures that the correct amino acid is added to the growing chain.
6. The amino acids bond together, each in turn. The ribosome moves along the mRNA, exposing codons that attract still more tRNAs with their attached amino acids.
7. The process concludes when a “stop code” is reached. The newly formed polypeptide and the mRNA molecule are released from the ribosome.
8. **The Molecular Basis of Heredity** Molecular biology seeks to explain living organisms by studying them at the molecular level, using molecules like DNA and RNA.
9. The central dogma of molecular biology is that information is transferred from DNA to RNA to protein.
