Rubin, 2013-11-01 Now in its third edition this classic book is widely considered the leading text on Bayesian methods lauded for its accessible practical approach to analyzing data and solving research problems Bayesian Data Analysis Third Edition continues to take an applied approach to analysis using up to date Bayesian methods The authors all leaders in the statistics community introduce basic concepts from a data analytic perspective before presenting advanced methods Throughout the text numerous worked examples drawn from real applications and research emphasize the use of Bayesian inference in practice New to the Third Edition Four new chapters on nonparametric modeling Coverage of weakly informative priors and boundary avoiding priors Updated discussion of cross validation and predictive information criteria Improved convergence monitoring and effective sample size calculations for iterative simulation Presentations of Hamiltonian Monte Carlo variational Bayes and expectation propagation New and revised software code The book can be used in three different ways For undergraduate students it introduces Bayesian inference starting from first principles For graduate students the text presents effective current approaches to Bayesian modeling and computation in statistics and related fields For researchers it provides an assortment of Bayesian methods in applied statistics Additional materials including data sets used in the examples solutions to selected exercises and software instructions are available on the book's web page [Bayesian Data Analysis, Second Edition](#) Andrew Gelman, John B. Carlin, Hal S. Stern, Donald B. Rubin, 2003-07-29 Incorporating new and updated information this second edition of THE bestselling text in Bayesian data analysis continues to emphasize practice over theory describing how to conceptualize perform and critique statistical analyses from a Bayesian perspective Its world class authors provide guidance on all aspects of Bayesian data analysis and include examples of real statistical analyses based on their own research that demonstrate how to solve complicated problems Changes in the new edition include Stronger focus on MCMC Revision of the computational advice in Part III New chapters on nonlinear models and decision analysis Several additional applied examples from the authors recent research Additional chapters on current models for Bayesian data analysis such as nonlinear models generalized linear mixed models and more Reorganization of chapters 6 and 7 on model checking and data collection Bayesian computation is currently at a stage where there are many reasonable ways to compute any given posterior distribution However the best approach is not always clear ahead of time Reflecting this the new edition offers a more pluralistic presentation giving advice on performing computations from many perspectives while making clear the importance of being aware that there are different ways to implement any given iterative simulation computation The new approach additional examples and updated information make Bayesian Data Analysis an excellent introductory text and a reference that working scientists will use throughout their professional life [Bayesian Data Analysis](#) Andrew Gelman, John B. **Bayesian Claims Reserving Methods in Non-life Insurance with Stan** Guangyuan Gao,2018-12-31 This book first provides a review of various aspects of Bayesian statistics It then investigates three types of claims reserving models in the Bayesian framework chain ladder models basis expansion models involving a tail factor and multivariate copula models For the Bayesian inferential methods this book largely relies on Stan a specialized software environment which applies Hamiltonian Monte Carlo method and variational Bayes

**Capture-Recapture: Parameter Estimation for Open Animal Populations** George A. F. Seber,Matthew R. Schofield,2019-08-13 This comprehensive book rich with applications offers a quantitative framework for the analysis of the various capture recapture models for open animal populations while also addressing associated computational methods The state of our wildlife populations provides a litmus test for the state of our environment especially in light of global warming and the increasing pollution of our land seas and air In addition to monitoring our food resources such as fisheries we need to protect endangered species from the effects of human activities e g rhinos whales or encroachments on the habitat of orangutans Pests must be controlled whether insects or viruses and we need to cope with growing feral populations such as opossums rabbits and pigs Accordingly we need to obtain information about a given population s dynamics concerning e g mortality birth growth breeding sex and migration and determine whether the respective population is increasing static or declining There are many methods for obtaining population information but the most useful and most work intensive is generically known as capture recapture where we mark or tag a representative sample of individuals from the population and follow that sample over time using recaptures resightings or dead recoveries Marks can be natural such as stripes fin profiles and even DNA or artificial such as spots on insects Attached tags can for example be simple bands or streamers or more sophisticated variants such as radio and sonic transmitters To estimate population parameters sophisticated and complex mathematical models have been devised on the

basis of recapture information and computer packages This book addresses the analysis of such models It is primarily intended for ecologists and wildlife managers who wish to apply the methods to the types of problems discussed above though it will also benefit researchers and graduate students in ecology Familiarity with basic statistical concepts is essential
