**Extending the Theory of Composites to Other Areas of Science** Maxence Cassier,Ornella Mattei,2016 In Chapter 1 we review many of the linear equations of physics and write them in a canonical form appropriate to the theory of composites We show how conservation laws which have played a key role throughout the history of science can be generalized to equalities which we call boundary field equalities and inequalities Chapter 2 reviews the abstract theory of composites both for the effective tensor and for the associated Y tensor Chapter 3 shows that the problem of finding the Dirichlet to Neumann map which governs the response of inhomogeneous bodies for acoustics elastodynamics or electromagnetism can be reformulated as the problem of finding the effective tensor operator associated with an abstract problem in the theory of composites Thus many tools for bounding effective tensors extend to bounding the Dirichlet to Neumann map Chapter 4 with Maxence Cassier and Aaron Welters studies in depth the analyticity properties of the Dirichlet to Neumann map for electromagnetism as functions of the variables representing the permittivities and permeabilities of the phases multiplied by the frequency It is established that the map is an operator valued Herglotz function of these complex variables It is anticipated that this will be useful for establishing fundamental limits on performances of devices Chapter 5 explores bounds on the Dirichlet to Neumann map and the associated inverse problem of what can be said about the distribution of materials inside a body from surface measurements using the connection between Dirichlet to Neumann maps and effective tensors in composites Chapter 6 with Ornella Mattei derives bounds on the transient response of viscoelastic composites Significantly we found that the volume fractions of the phases could almost be exactly determined from measurements of the transient response at certain times Chapter 7 develops the algebra of finite dimensional subspace collections By relaxing the requirement that the subspaces are orthogonal we find that there is a rich algebraic structure

associated with subspace collections operations of addition subtraction multiplication division and substitution can all be defined Some of these operations are analogous to operations one can do with resistor networks In Chapter 8 we show this algebra has important uses in particular by substituting a collection with non orthogonal subspaces in one with orthogonal subspaces we can accelerate Fast Fourier transform methods for computing the effective tensor and fields in periodic conducting composites as demonstrated by the numerical results of Moulinec and Suquet Chapter 9 with Moti Milgrom looks at the response of multiphase bodies and composites to different fields which may be electric fields magnetic fields temperature gradients or concentration gradients which interact in the components due to coupling terms Chapter 10 with Maxence Cassier and Aaron Welters develops a rigorous basis for the field equation recursion method for composites of two isotropic phases This uses a stratification of the Hilbert space and an inductive procedure to link together a sequence of associated effective tensors Chapter 11 shows that by minimising the integral of the square of the Schrodinger equation one can develop a density functional theory for excited states in multielectron systems called Projection functional theory Chapter 12 shows one can desymmetrize the Schr dinger equation and develop iterative FFT methods for solving it which at each step only require Fourier transforms in the coordinates of just two electrons Chapter 13 develops minimization variational principles for Schrodinger s equation for excited states when the energy is complex and explores certain quadratic functions which have properties that could be useful in analysis Chapter 14 shows how one can obtain Green s functions for problems with non self adjoint operators
