## **Database System Concepts 6th Edition By Silberschatz Korth And Sudarshan:**

*Database System Concepts* Henry F. Korth, S. Sudarshan, Abraham Silberschatz, Professor, 2010-01-27 Database System Concepts by Silberschatz Korth and Sudarshan is now in its 6th edition and is one of the cornerstone texts of database education. It presents the fundamental concepts of database management in an intuitive manner geared toward allowing students to begin working with databases as quickly as possible. The text is designed for a first course in databases at the junior senior undergraduate level or the first year graduate level. It also contains additional material that can be used as supplements or as introductory material for an advanced course. Because the authors present concepts as intuitive descriptions, a familiarity with basic data structures, computer organization, and a high level programming language are the only prerequisites. Important theoretical results are covered, but formal proofs are omitted. In place of proofs, figures and examples are used to suggest why a result is true.

*Stream Data Processing: A Quality of Service Perspective* Sharma Chakravarthy, Qingchun Jiang, 2009-04-09 In recent years, a new class of applications has come to the forefront primarily due to the advancement in our ability to collect data from multitudes of devices and process them efficiently. These include homeland security applications, sensor pervasive computing applications, various kinds of monitoring applications, and even traditional applications belonging to financial, computer network management, and telecommunication domains. These applications need to process data continuously and as long as data is available from one or more sources. The sequence of data items continuously generated by sources is termed a data stream. Because of the possible never-ending nature of a data stream, the amount of data to be processed is likely to be unbounded. In addition, timely detection of interesting changes or patterns or aggregations over incoming data is critical for many of these applications. Furthermore, the data arrival rates may fluctuate over a period of time and may be bursty at times. For most of these applications, Quality of Service or QoS requirements such as response time, memory usage, and throughput are extremely important. These application requirements make it infeasible to simply load the incoming data streams into a persistent store and process them efficiently using currently available database management techniques.
