

TYPES OF AND TRANSITIONS IN ECD (ELECTRONICALLY CONTROLLED DIESEL) SYSTEMS

- ECD systems include the ECD-V series (V3, V4, and V5) which implements electronic control through distributed pumps (V3 type pumps) and common rail systems made up of a supply pump, rail, and injectors. Types are the ECD-V3 and V4 for passenger cars and trucks, the ECD-V4 that can also support small trucks, common rail systems for trucks, and common rail systems for passenger cars and trucks. In addition, there are 2nd generation common rail systems that support both large vehicle and passenger car applications. The chart below shows the characteristics of these systems.

COMMON RAIL SYSTEM CHARACTERISTICS

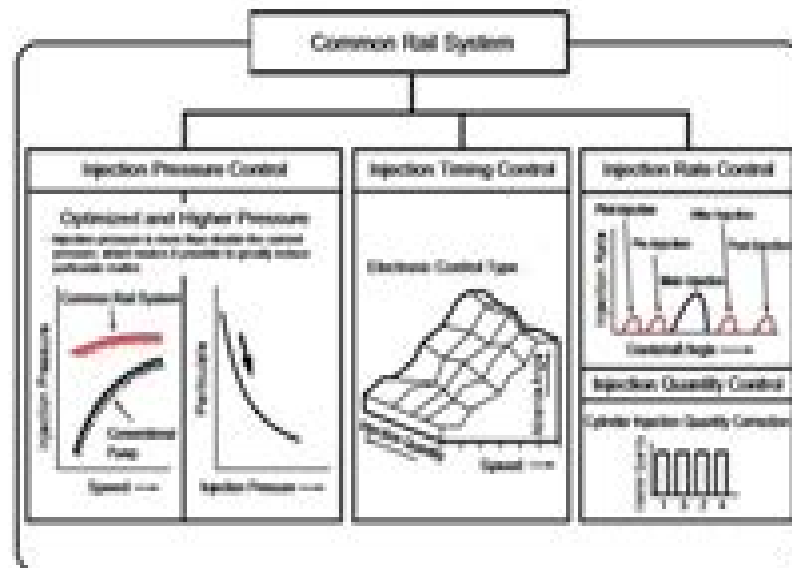

- The common rail system uses a type of accumulation chamber called a rail to store pressurized fuel, and injectors that control electronically controlled external valves to inject the pressurized fuel into the cylinders.
- Because the engine ECU controls the injection system (including the injection pressure, injection rate, and injection timing), the injection system is independent and thus unaffected by the engine speed or load.
- Because the engine ECU can control injection quantity and timing to a high level of precision, even multi injection (puls type fuel injections in one injection stroke) is possible.
- This ensures a stable injection pressure at all times, even in the low engine speed range, and dramatically decreases the amount of black smoke initially emitted by a diesel engine during start-up and acceleration. As a result, exhaust gas emissions are cleaned and reduced, and higher power output is achieved.

ECD-V5

- For the background of common rail fuel injection systems, see the materials at the end of this document.

A. Features of Injection Control
