

6.3 Modulating Control (Optional)

In the 'Modulating' mode the opening and closing of the suction regulator inlet valve is controlled by the negative regulator. As the demand for compressed air rises and falls, the valve modulates between fully open and fully closed.

When the compressor is started and runs up to load, the minimum pressure valve opens and air under pressure passes from the separator vessel into the user's pipework. If the air pressure in the user's pipework is below the setting of the negative regulator, the output signal from the negative regulator will cause the suction regulator inlet valve to open and the compressor will run on-load.

Rising pressure in the separator vessel will cause the output signal from the negative regulator to fall, progressively closing the inlet valve to match air flow to demand.

If the pressure in the user's pipework rises above the setting of the negative regulator and reaches the upper set point, the controller de-energises the unloader solenoid valve. The valve closes, shutting off the regulation air supply to the suction regulator. The suction regulator inlet valve closes and the compressor runs in the off-load condition.

When the pressure in the user's pipework falls to the lower set point the compressor reverts to running on-load.
