SAFETY CONSIDERATIONS

Air-conditioning equipment will provide safe and reliable service when operated within design specifications. The equipment should be operated and serviced only by authorized personnel who have a thorough knowledge of system operation, safety devices and emergency procedures.

Good judgement should be used in applying any manufacturer's instructions to avoid injury to personnel or damage to equipment and property.

GENERAL

The System Pilot (33PILOT-01) is a component of Carrier's 3V™ control system and serves as the user-interface and configuration tool for all Carrier communicating devices. The System Pilot can be used to install and commission a 3V zoning system, linkage compatible air source, universal controller, and all other devices operating on the Carrier communicating network.

Additionally, the System Pilot can serve as a wall-mounted temperature sensor for space temperature measurement. The occupant can use the System Pilot to change set points and cause occupancy overrides. A security feature is provided to limit access of features for unauthorized users.

OPERATION

Power-Up Display — When the System Pilot is powered up, it attaches (initiates communication) to a device that has been designated as the System Pilot's default device. The System Pilot then displays that device's custom Default screen, if such a screen exists. If the System Pilot attaches to an

external device that does not have a custom Default screen, the System Pilot reads that device's first status table and displays it as the Default screen.

DEFAULT DEVICE DESIGNATION — If the System Pilot is connected to a local bus of a VVT® zone controller (Comm2), the default device is the local zone controller. If the System Pilot is on the Carrier communication bus, the default device is user-selectable from the PILOTCON Table screen.

If the System Pilot is not connected to a local or Carrier bus device and no default device has been configured, the default device is the System Pilot itself. The default device can also be a device that has been designated as the remote attach device (from the REMOTE Table). A remote attach device is a designated Carrier network device to which the System Pilot will write space temperature, compute an operating mode for, and monitor and modify set points.

All custom Default screens display the day of week, time, and space or duct temperature. Other contents will vary according to the attached device type. Examples of Default screens for the System Pilot, VVT zone controller, and Bypass Controller are shown in Fig. 1-3.
