Control Features

The TP75-RF is a wireless communication version of the standard hardwired TP75 programmable thermostat. The TP75-RF, which contains a transmitter, works in conjunction with an RX receiver module which can be located up to 30m from the thermostat.

The TP75-RF Series of programmable room thermostats incorporate two special features that can be enabled at the time of installation - Optimum Start Control and Chrono-proportional Control.

Optimum Start Control (OSC)

With this enabled the event 1 control temperature, (which would normally be an increase from an overnight set-back temperature), may be programmed to be achieved by a desired time. The heating plant will be switched on earlier than the programmed time by a period related to the start-up curve selected and the space temperature sensed at the beginning of the selected start-up period. The diagram below indicates the switch on periods for the available start-up curves.

If OSC is disabled then the unit will operate as a conventional room thermostat, switching on the heating plant at the event 1 time with the event 1 temperature being achieved in a time related to the prevailing conditions.

Battery Compartment Flap closed

Chrono-proportional Control

Traditional ON/OFF room thermostats control room temperature by switching the circulating pump, and usually the boiler, on and off.

Because of the thermal inertia of the heating equipment and the relatively large switching differentials of on/off devices large space temperature variations often occur, resulting in poor comfort conditions.

Chrono-proportional Control as implemented in the TP75-RF overcomes the problem by ensuring that the boiler fires regularly for periods calculated to maintain radiator temperature without overheating and to prevent the radiator temperature falling to a level which can allow down draughts from cold surfaces, e.g. windows, to cause discomfort.

The control logic works on a proportional band of 4°F which assumes that the boiler will operate at full load when the sensed space temperature is 4°F or more lower than the programmed set point.

The following graph shows the relative on/off periods per cycle against variances in deviation from the set point.
