### CONCEPT:

Convection Current in the Water

### CONVECTION CURRENT

Less dense particles rise while denser particles sink. When particles are heated or become hot, they become less dense. When particles are cooled or become cold, they become denser. This means that hot particles rise while cold particles sink.

When water is heated, the water particles close to the heat source will rise. The water particles above or away from the heat source which are cold will sink. As the hot water particles rise they become farther and farther from the heat source and some of the heat slowly dissipate causing them to become cold and sink towards the heat source.

As the cold water particles sink they become closer and closer to the heat source and slowly gain heat. This causes them to rise.

The process continues into a cycle of rising and sinking of particles as long as there is a heat source. This process is known as **CONVECTION CURRENT**.

### CONVECTION CURRENT IN THE EARTH'S MANTLE

The convection current explained above is the same with the convection current happening in the Earth's mantle. The only difference is that instead of water particles, the magma in the mantle is the one that is rising and sinking brought about by the heat from the Earth's core, which is the heat source.

As the hot and less dense magma rises in the mid-ocean ridge, it spreads out forcing the lithospheric plates to separate and also new crust is formed. This point indicates the divergent plate boundary where ridges or rift valleys are formed. Also, this point is where the seafloor spreads.

As the plates spread, the formed crust slowly cools down and becomes denser. As they meet a crust that is less dense, the denser crust is pushed against the less dense crust. This causes subduction to occur where the denser crust sinks under the less dense crust. This point indicates the convergent plate boundary where trenches and volcanic arcs are formed. As the denser crust sinks and reaches the mantle, it slowly melts into magma because of the high pressure and temperature in the mantle. The magma slowly sinks until it becomes hot again and rises.

The convection current brought about by the upward (rising) movement and downward (sinking) movement of the magma causes the movement of the plates on the lithosphere. These movements results to the different plate boundaries, drifting of continents, and spreading of the seafloor. In turn, these explain the origins of volcanoes, earthquakes, and other geologic features that we observe on the surface.
