1. Which two criteria does a switch use to select the root bridge? (Choose two.)

- bridge priority
- switching speed
- number of ports
- base MAC address
- switch location
- memory size

2. Which two statements are true about the default operation of STP in a Layer 2 switched environment that has redundant connections between switches? (Choose two.)

The root switch is the switch with the highest speed ports.

Decisions on which port to block when two ports have equal cost depend on the port priority and identity.

All trunking ports are designated and not blocked.

Root switches have all ports set as root ports.

Non-root switches each have only one root port.

3.

Refer to the exhibit. All switches in the network have empty MAC tables. STP has been disabled on the switches in the network. How will a broadcast frame that is sent by host PC1 be handled on the network?

Switch SW1 will block the broadcast and drop the frame.

Switch SW1 will forward the broadcast out all switch ports, except the originating port.

This will generate an endless loop in the network.

Switch SW1 will forward the broadcast out all switch ports, except the originating port. All hosts in the network will reply with a unicast frame sent to host PC1.
