Coal Mining Underground Mining:

Coal Mine Ground Control Marcel Talbot, 2016-04 The goal of coal mining is to obtain coal from the ground Coal is valued for its energy content and since the 1880s has been widely used to generate electricity Steel and cement industries use coal as a fuel for extraction of iron from iron ore and for cement production Coal mining has had many developments over the recent years from the early days of men tunneling digging and manually extracting the coal on carts to large open cut and long wall mines Mining at this scale requires the use of draglines trucks conveyors jacks and shearers The most economical method of coal extraction from coal seams depends on the depth and quality of the seams and the geology and environmental factors Coal mining processes are differentiated by whether they operate on the surface or underground Surface mining and deep underground mining are the two basic methods of mining The choice of mining method depends primarily on depth of burial density of the overburden and thickness of the coal seam Seams relatively close to the surface at depths less than approximately 180 ft 50 m are usually surface mined Coal that occurs at depths of 180 to 300 ft 50 to 100 m is usually deep mined but in some cases surface mining techniques can be used Most coal seams are too deep underground for opencast mining and require underground mining a method that currently accounts for about 60 percent of world coal production This book entitled *Coal Mine Ground Control* covers every major topic concerned with ground control in underground coal mines with emphasis on the application of various ground control theories and techniques The book reviews current general practices in underground mine layouts roof control and common ground control failures and the discussion of the state of the art of coal mine ground control technology The book will also prove useful to practical engineers involved in either the design or the day to day operations of underground coal mines

Council, Division of Behavioral and Social Sciences and Education, Board on Human-Systems Integration, Committee on Mine Safety: Essential Components of Self-Escape, 2013-07-26 Coal mine disasters in the United States are relatively rare events many of the roughly 50 000 miners underground will never have to evacuate a mine in an emergency during their careers However for those that do the consequences have the potential to be devastating U S mine safety practices have received increased attention in recent years because of the highly publicized coal mine disasters in 2006 and 2010 Investigations have centered on understanding both how to prevent or mitigate emergencies and what capabilities are needed by miners to self escape to a place of safety successfully This report focuses on the latter the preparations for self escape In the wake of 2006 disasters the U S Congress passed the Mine Improvement and New Emergency Response Act of 2006 MINER Act which was designed to strengthen existing mine safety regulations and set forth new measures aimed at improving accident preparedness and emergency response in underground coal mines Since that time the efforts of the National Institute of Occupational Safety and Health NIOSH and the Mine Safety and Health Administration MSHA have contributed to safety improvements in the mining industry However the Upper Big Branch mine explosion in 2010 served as a reminder to remain ever vigilant on improving the prevention of mine disasters and preparations to help miners survive in the event of emergencies This study was set in the context of human systems integration HSI a systems approach that examines the interaction of people tasks and equipment and technology in the pursuit of a goal It recognizes this interaction occurs within and is influenced by the broader environmental context A key premise of human systems integration is that much important information is lost when the various tasks within a system are considered individually or in isolation rather than in interaction with the whole system Improving Self Escape from Underground Coal Mines the task of self escape is part of the mine safety system

Pazdziora, 2012-12-02 The escalating worldwide demand for energy has had the effect among other things of promoting the development of coal mining In some countries specialist design offices were set up and students trained as specialists in mine design and construction Poland a country having mining traditions stretching over many centuries is a good example and has

gained a place in the forefront not only as a coal producer and exporter but also as an originator and exporter of technical mining know how The author of this book has himself had 25 years of practical experience in mine design in the supervision of mining investment implementation both at home and abroad and also in directing the activities of the Chief Mine Design and Studies Office in Poland plus more than 20 years teaching experience in the training of mining engineers in particular as head of the Mine Design Department of the Mining Faculty at the Silesian Polytechnic University in Gliwice This vast wealth of experience has prompted him to write the present book which discusses the basic problems met with in the design of underground hard coal mines The author s primary aim has been to deal with all those questions in mine design which have not yet been answered in mining textbooks and which from his own personal experience he considers to be of importance Accordingly he presents the general principles governing the design of new mines and the reconstruction of working mines the development of mining regions the design of coal preparation plant and energy economy in mines Making use of the broad experience gained by the Polish mining industry in the implementation of mining investment projects he has quoted several examples of technical and organizational solutions which effectively shorten the mine construction cycle The book is addressed chiefly to investors and engineers engaged in preparing plans for the development of mining regions for the construction of new mines and the reconstruction of existing mines and preparation plants as well as to students in mining departments of technical schools and universities The information offered here is of great practical value and may well stimulate the development of new ideas for design and implementation concepts
