**CURED I - LENT Late Effects of Cancer Treatment on Normal Tissues** Philip Rubin, L.S. Constine, Lawrence B. Marks, Paul Okunieff, 2007-12-27 The rapid advances in radiation oncology radiation biology and radiation therapy physics have led to an accumulation of information on the interactions of radiation with other therapeutic modalities such as the wide array of chemotherapeutic agents being employed in combination with radiation therapy as well as the multiple biologic response modifiers that are being used in combination with radiation therapy It is now recognized that they have a significant impact on normal tissue toxicities The radiation doses customarily deemed safe on the basis of past experience have now when combined with other modalities led to severe late effects in different vital organs The previously defined radiation tolerance dosages remain as valuable guides but their applicability has changed significantly The emphasis is now placed on the volume of the organ irradiated as well as the dose being used New constructs relating global whole organ and focal partial volume injury as a function of the dose volume histogram emerge as a significant predictor of late effects on normal tissues There are now mathematical models such as the model on standard dose time dose factors and accumulated radiation effects that have been supplanted by linear quadratic equations using the alpha beta ratio and its clinical applicability to normal tissue complications This volume presents contemporary data relating to late effects on normal tissues *ALERT - Adverse Late Effects of Cancer Treatment* Philip Rubin, Louis S.
