**Structures** Thomas T. C. Hsu,Yi-Lung Mo,2010-03-16 Unified Theory of Concrete Structures develops an integrated theory  
 that encompasses the various stress states experienced by both RC PC structures under the various loading conditions of  
 bending axial load shear and torsion Upon synthesis the new rational theories replace the many empirical formulas currently  
 in use for shear torsion and membrane stress The unified theory is divided into six model components a the struts and ties  
 model b the equilibrium plasticity truss model c the Bernoulli compatibility truss model d the Mohr compatibility truss model  
 e the softened truss model and f the softened membrane model Hsu presents the six models as rational tools for the solution  
 of the four basic types of stress focusing on the significance of their intrinsic consistencies and their inter relationships  
 Because of its inherent rationality this unified theory of reinforced concrete can serve as the basis for the formulation of a  
 universal and international design code Includes an appendix and accompanying website hosting the authors finite element
