

LAB: Classifying Rocks

Which rocks can be used for radiometric dating to determine the age of the rock and help us determine the age of the Earth?

Purpose: The purpose of this lab is to observe the characteristics of rocks to determine which can be used for radiometric dating.

Background: The three types of rocks are igneous, sedimentary, and metamorphic rocks. Only igneous rocks can be used for radiometric dating. In order to know which rocks can be used for radiometric dating, scientists must know which rocks to select as samples for dating.

Directions: During this lab you will classify the provided rock as igneous, sedimentary, or metamorphic based on their observable characteristics and determine which would be used for radiometric dating. Examine each rock and read through the description on the rocks guide. Once you have determined what type of rock it is, place the rock on the corresponding color of paper and record in your observation data table.
