

hereinafter: software download fault, initialization failure, coverage fault and module fault.

## 2.2.1 Software Download Fault

### I. Fault Description

Software download faults include software download failure, maintenance console prompting failure or the failure of generating correct prompt information. For ODU3601C, the software to be downloaded is the software of Micro-bts transceiver Module (MTRM).

### II. Troubleshooting

Software download failure may be caused by the following two factors: The failure of downloading software to the upper-level BTS and the file loading operation abnormally terminated by the board

- Failure of downloading software to upper-level BTS
  - 1) Check whether the OMU BOOTP of the upper-level BTS is normal

The BOOTP failure may be caused by a blocked link, incorrect route or configuration errors, etc. These causes should be analyzed one by one to eliminate the faults.

- 2) Check whether the FTP server in BAM is configured correctly.

The FTP server configuration includes the following four items: user name, password, user access path and access authority. Incorrect configuration of any of these four items may lead to user login failure and software loading failure.

Related details are available in the "BTS Maintenance" module of the user manual of the upper-level BTS.

- File loading terminated abnormally by board

All files should carry a correct file header in the specific format as required. The file ID and file version in the header should match that in the activation commands released by the OMC, otherwise the board may consider the software to be downloaded is not what is expected and thus prompt exceptional errors.

## 2.2.2 Initialization Failure

### I. Fault Description

When the ODU3601C is powered on, the system initialization aborts, which leads to the BTS start-up failure.

Upon this failure, the ACT indicator of MTRM keeps flashing fast.
