

7 *

Determine the Concept The first zeroes in the intensity occur at angles given by $\sin \theta = \lambda/a$. Hence, decreasing a increases θ and the diffraction pattern becomes wider.

8 *

Determine the Concept Equation 33-2 expresses the condition for an intensity maximum in slit interference. Here d is the slit separation, λ the wavelength of the light, m an integer, and θ the angle at which the interference maximum appears.

Equation 33-11 expresses the condition for the first minimum in single-slit diffraction. Here a is the width of the slit, λ the wavelength of the light, and θ the angle at which the first minimum appears, assuming $m = 1$.

9 *

Picture the Problem We can solve $d \sin \theta = m\lambda$ for θ with $m = 1$ to express the location of the first-order maximum as a function of the wavelength of the light.

The interference maxima in a diffraction pattern are at angles θ given by:

$$d \sin \theta = m\lambda$$

where d is the separation of the slits and $m = 0, 1, 2, \dots$

Solve for the angular location θ_1 of the first-order maximum :

$$\theta_1 = \sin^{-1}\left(\frac{\lambda}{d}\right)$$

Because $\lambda_{\text{green light}} < \lambda_{\text{red light}}$:

$$\theta_{\text{green light}} < \theta_{\text{red light}} \text{ and } \boxed{(a) \text{ is correct.}}$$

***10** *

Determine the Concept The distance on the screen to m th bright fringe is given by

$$y_m = m \frac{\lambda L}{d},$$

where L is the distance from the slits to the screen and d is the separation of

the slits. Because the index of refraction of air is slightly larger than the index of refraction of a vacuum, the introduction of air reduces λ to λ/n and decreases y_m . Because the separation of the fringes is $y_m - y_{m-1}$, the separation of the fringes decreases and $\boxed{(b) \text{ is correct.}}$

11 *

(a) False. When destructive interference of light waves occurs, the energy is no longer distributed evenly. For example, light from a two-slit device forms a pattern with very bright and very dark parts. There is practically no energy at the dark fringes and a great deal of energy at the bright fringe. The total energy over the entire pattern equals the

For all readers interested in calculus based physics *Optics* Charles S. Adams, Ifan G. Hughes, 2018-11-30 This textbook on optics provides an introduction to key concepts of wave optics and light propagation. It uniquely makes extensive use of Fourier methods and the angular spectrum approach, especially to provide a unified approach to Fraunhofer and Fresnel diffraction. A recurring theme is that simple building blocks such as plane and spherical waves can be summed to construct useful solutions. The text pays particular attention to analysing topics in contemporary optics such as propagation, dispersion, laser beams and wave guides, apodisation, tightly focused vector fields, unconventional polarization states and light-matter interactions. Throughout the text, the principles are applied through worked examples, and the book is copiously illustrated with more than 240 figures. The 200 end-of-chapter exercises offer further opportunities for testing the reader's understanding.
