Response/Resistance to PD-1 Axis Inhibitors: Focus on the Tumor Microenvironment Thazin N. Aung, Ioannis Vathiotis, Arutha Kulasinghe, 2025-11-17 PD-1 axis inhibitors are a group of immune checkpoint inhibitors (ICIs) that block the PD-1/PD-L1 interaction to reinstate immune recognition The tumor microenvironment (TME) is complex and ever changing and can affect response to anticancer therapies including PD-1 axis inhibitors Despite the established efficacy of PD-1 axis inhibitors not all patients respond to treatment and some will develop resistance Therefore it is essential to understand the factors that contribute to primary or secondary treatment resistance to develop new approaches and ultimately improve patient outcomes This Research Topic aims to explore different aspects of the TME that contribute to response resistance to PD-1 axis inhibitors including

- 1 Understanding resistance mechanisms Gaining a better understanding of the mechanisms behind immunotherapy resistance is crucial in developing effective strategies to overcome it This involves studying the cellular interactions and molecular alterations within the TME that contribute to immunosuppression
- 2 Combinatorial strategies Rational and synergistic combination therapies can be designed to lower the risk of resistance and prolong the benefits of immunotherapy This may involve combining ICIs or adding different treatment modalities such as chemotherapy or local therapies
- 3 Enhancing immune response Strategies that aim to enhance the immune response of T and NK cells have shown promise in overcoming immunotherapy resistance This can be achieved through various approaches such as targeting immunosuppressive factors in the TME
- 4 Targeting specific mechanisms Identifying specific mechanisms of resistance such as inactivation of antigen presentation can help develop tailored therapies to overcome resistance

We are interested in Original Research Systematic Review Methods Review Mini Review Clinical Trial Case Report Brief Research Report Study Protocol and Technology and Code articles focusing on but not limited to the following areas Various cellular and molecular alterations within the TME that contribute to immunotherapy resistance particularly the resistance mechanisms that are currently being targeted by novel therapeutic

strategies This can include intrinsic mechanisms e g cell signaling immune recognition gene expression extrinsic mechanisms e g T cell activation neo angiogenesis and specific pathways or molecules that play a role in immunotherapy resistance Preclinical and clinical treatment approaches that have shown promise in lowering the risk of resistance and prolonging the benefits of immunotherapy Combination therapies that aim to overcome immunotherapy resistance The emerging role of antibody drug conjugates ADCs in shaping the immune microenvironment and increasing treatment efficacy of ICIs
