

POPULATIONS

MARK AND RECAPTURE

Name: _____

Estimate the total population of snails on the farm by using the equation below.

$$\text{Estimation of total population} = \frac{(\text{Total number captured}) \times (\text{number marked})}{(\text{Total number captured with marks})}$$

MARK AND RECAPTURE

Name: _____

Some populations are not so patient and easy to count as snails. For example, animals are constantly moving, making the random sampling method much more difficult. In these situations, ecologists turn to the mark and recapture method to estimate population size.

In this method, a certain number of individuals are captured, tagged, and released. After some time has passed, the scientists will return to the area and capture more individuals. The ratio of known individuals to the estimated total is used to estimate the total population.

- Given the known population in this month, calculate the ratio.

- Compare and contrast estimating populations with and without marks.

You are a part of a 4th grade field trip to the farm. You return to the farm again in the fall to see how the population has changed.

Year	1
Number of snails captured	10
Number of snails captured with marks	5

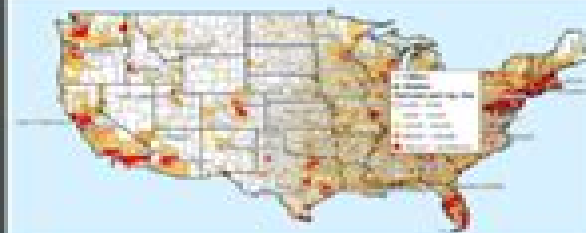

Calculate the total by multiplying 10 times 5.

Count the total sum captured by adding marked snails per 5.

POPULATION DENSITY

Name: _____

Population density is an average. In reality, these countries will all have much denser and less dense areas. Study the map below and answer the following questions.

- Where, in general, is the most densely populated?
- Where, in general, is the most sparsely populated?
- How do you think life in these two areas is different? How is it similar?

- Governments must ensure that their citizens have all the resources they need to live: food, water, electricity, housing, clothing, etc. Do you think it's easier to provide for a dense or sparse population? Why?

POPULATION DENSITY

Name: _____

Population density is a measure of how many individuals are packed into a certain amount of space. Ecologists determine population density by dividing the number of individuals by the total amount of space. Use the equation below to determine the population density of each of the countries listed below.

$$\text{Population Density} = \frac{\text{Number of individuals}}{\text{Area}}$$

RANDOM SAMPLING

Name: _____

Estimate the average number of ants per grid by 100 (the total number of grids to determine your population estimate).

Count the number of ants shown in boxes to find the actual population.

- How close was it?
- Even though it's a random sample, how close was it?
- A biologist notes the point is a 10.0 ant per grid.
- A 10x10 study is used to estimate the total number of ants in the area.

RANDOM SAMPLING

Name: _____

In nature, it's usually impossible to count an entire population. Instead, scientists must estimate. One method for estimating population size is random sampling.

You will use the random sampling method to estimate the total number of ants in a field. First, your team has divided the field into 1000 equal sized patches of land. 10 patches have been randomly selected for you and your team to examine closely. Count the number of ants in each of the selected areas and record it in the table below.
