**The Impact of Microorganisms on Consumption of Atmospheric Trace Gases** Steffen Kolb,Marcus A. Horn,J. Colin Murrell,Claudia Knief,2017-11-29 Gases with a mixing ratio of less than one percent in the lower atmosphere i e the troposphere are considered as trace gases Numerous of these trace gases originate from biological processes in marine and terrestrial ecosystems These gases are of relevance for the climate as they contribute to global warming or to the troposphere s chemical reactive system that builds the ozone layer or they

impact on the stability of aerosols greenhouse and pollutant gases These reactive trace gases include methane a multitude of volatile organic compounds of biogenic origin bVOCs and inorganic gases such as nitrogen oxides or ozone The regulatory function of microorganisms for trace gas cycling has been intensively studied for the greenhouse gases nitrous oxide and methane but is less well understood for microorganisms that metabolize molecular hydrogen carbon monoxide or bVOCs The studies compiled in this Research Topic reflect this very well While a number of articles focus on nitrous oxide and methane or carbon monoxide oxidation only a few articles address conversion processes of further bVOCs The Research Topic is complemented by three review articles about the consumption of methane and monoterpenes as well as the role of the phyllosphere as a particular habitat for trace gas consuming microorganisms and point out future research directions in the field The presented scientific work illustrates that the field of microbial regulation of trace gas fluxes is still in its infancy when one broadens the view on gases beyond methane and nitrous oxide However there is a societal need to better predict global dynamics of trace gases that impact on the functionality and warming of the troposphere Upcoming modelling approaches will need further information on process rates features and distribution of the driving microorganisms to fulfill this demanding task
