With over 30 years of continuous software development and innovation, the ECLIPSE simulator combines extensive capabilities, computational robustness, speed, and unmatched platform coverage.

Simulate any field type, any recovery method

The ECLIPSE simulator covers the entire spectrum of reservoir simulation, including black oil, compositional, thermal finite volume reservoir, and streamline simulation. This enables you to simulate any type of reservoir, with any recovery method—from waterflooding to heavy oil recovery and chemical enhanced oil recovery (EOR).

Blackoil simulation

The ECLIPSE Blackoil simulator is the industry standard for reservoir modeling. It supports three-phase, 3D reservoir simulation with a huge range of capabilities, including extensive well controls, field operations planning, fault and fracture networks, aquifers, tracer tracking, advanced well and completion modeling, and EOR schemes.

Compositional simulation

The ECLIPSE Compositional simulator provides full equation of state modeling for multicomponent hydrocarbon flow in reservoirs in which there are compositional changes with depth, condensates or volatile crude oils, and gas injection programs. In addition to supporting the same unrivalled range of capabilities as the Blackoil simulator, the ECLIPSE Compositional simulator allows you to model chemical reactions, and CO₂ flooding and storage.

Thermal simulation for heavy oil recovery

Thermal recovery methods are required for heavy oil reservoirs in which oil viscosity changes as a function of temperature. The ECLIPSE Thermal simulator supports a wide range of thermal recovery process, including steam injection, steam flooding, steam assisted gravity drainage (SAGD), hot or cold fluid injection, wellbore heaters, in situ combustion, and cold heavy oil production with sand.

Production Technology for Deep Reservoirs Yan Peng, Yishan Liu, Hongyan Qu, Feng Dong, Jiehao Wang, 2024-11-28

Underground energy is important for the whole society development but conventional underground energy is becoming exhausted. The energy for deep reservoirs usually 3500m for petroleum engineering 1000m for mining engineering is diverse including not limited shale gas oil tight gas oil hot dry rock geothermal reservoirs and coal gasification. Although it has abundant reserves the energy production from deep reservoirs is difficult in stimulations because the geological conditions for those deep reservoirs are tougher than those for conventional reservoirs such as high in situ stress obvious heterogeneity in rock properties and complex natural fracture networks. Meanwhile common technologies also have environmental impacts. The development trend of production technology for deep reservoirs requires it to be environment friendly or decrease environmental impacts at least CO₂ utilization may achieve this environmental aim. In order to efficiently produce energy from deep reservoirs technological innovation is booming around North America Europe and Asia.
