Water birds such as anhingas, along with a variety of other plants and animals, rely on the presence of wetlands for their survival. How might the loss of wetland areas affect these aquatic species? Learning about organisms and how they interact with one another, with other species, and with their environment is what the study of ecology is all about.

MAIN IDEA

Ecologists study environments at different levels of organization.

Over their life cycle, Pacific salmon are the main food source for more than 140 species of wildlife, including grizzly bears, as shown in **FIGURE 1.1**. If they are not eaten, their bodies return vital nutrients back into the river system, some of which are used by plants to grow. In addition to their role in the health of river systems, salmon are also important to the Pacific Northwest's economy. Today, many species of wild Pacific salmon are threatened with extinction due to competition from hatchery fish, blocked river paths, and loss of spawning grounds. As salmon populations decline, how are other species affected? What effect would the loss of salmon have on a local and a global scale? These are the types of questions ecologists are trying to answer.

FIGURE 1.1 Salmon are a primary food source for many species, including grizzly bears. If salmon disappeared, species dependent on them would also suffer.

What Is Ecology?

Ecology is the study of the interactions among living things, and between living things and their surroundings. The word *ecology* comes from the Greek word *oikos*, which means "house." This word origin makes sense if you think of Earth as home and all organisms as members of Earth's household. Ernst Haeckel, a German biologist, coined the term *ecology* in 1866 to encourage biologists to consider the ways organisms interact. Until that time, most scientists studied a plant or an animal as though it existed in isolation—as if it did not affect its surroundings, and its surroundings did not affect it.
