Cardoso, Pedro C. Diniz, 2011-04-02 The extreme exibility of recon gurable architectures and their performance pot tial have made them a vehicle of choice in a wide range of computing domains from rapid circuit prototyping to high performance computing The increasing availab ility of transistors on a die has allowed the emergence of recon gurable architectures with a large number of computing resources and interconnection topologies To ploit the potential of these recon gurable architectures programmers are forced to map their applications typically written in high level imperative programming l guages such as C or MATLAB to hardware oriented languages such as VHDL or Verilog In this process they must assume the role of hardware designers and software programmers and navigate a maze of program transformations mapping and synthesis steps to produce ef cient recon gurable computing implementations The richness and sophistication of any of these application mapping steps make the mapping of computations to these architectures an increasingly daunting process It is thus widely believed that automatic compilation from high level programming languages is the key to the success of recon gurable computing This book describes a wide range of code transformations and mapping te niques for programs described in high level programming languages most tably imperative languages to recon gurable architectures      *Data Processing Digest* ,1980
