the observer who is at rest

$$f = \frac{v}{\lambda}$$

$$\lambda' = \frac{v - v_s}{f} \quad f' = \frac{v}{v - v_s} f$$

$$\lambda'' = \frac{v + v_s}{f} \quad f'' = \frac{v}{v + v_s} f$$

Wavelength (λ) and frequency (f) of sound waves emitted by the source, and are moving with a velocity v

Motion of the source that is moving with velocity v_s relative to the observer alters the wavelength (λ' , λ'') and frequency (f' , f'') of sound waves

be explained as follows When the source of the waves is moving toward the observer each successive wave crest is emitted from a position closer to the observer than the previous wave Therefore each wave takes slightly less time to reach the observer than the previous wave Therefore the time between the arrival of successive wave crests at the observer is reduced causing an increase in the frequency While they are travelling the distance between successive wave fronts is reduced so the waves bunch together Conversely if the source of waves is moving away from the observer each wave is emitted from a position farther from the observer than the previous wave so the arrival time between successive waves is increased reducing the frequency The distance between successive wave fronts is increased so the waves spread out For waves that propagate in a medium such as sound waves the velocity of the observer and of the source is relative to the medium in which the waves are transmitted The total Doppler Effect may therefore result from motion of the source motion of the observer or motion of the medium Each of these effects is analyzed separately For waves which do not require a medium such as light or gravity in general relativity only the relative difference in velocity between the observer and the source needs to be considered
