

CHAPTER 4 ACTIVE READING WORKSHEETS**CELL STRUCTURE AND FUNCTION****Section 4-1: The History of Cell Biology**

Read the passage below, which covers topics from your textbook.
Answer the questions that follow.

The discovery of cells was made possible by the development of the microscope in the 17th century. In 1665, the English scientist Robert Hooke used a microscope to examine a thin slice of cork. Hooke described it as consisting of “a great many little boxes.” These “little boxes” reminded him of the cubicles or “cells” in which monks lived, so he called them cells.

What Hooke had observed were actually the remains of dead plant cells. The first person to observe living cells was a Dutch trader, Anton van Leeuwenhoek. Although van Leeuwenhoek’s microscope was rather simple, in 1673 it was powerful enough to enable him to view the world of microscopic organisms which had never before been seen.

About 150 years passed before scientists began to organize the observations begun by Hooke and van Leeuwenhoek into a unified theory known as the cell theory. This theory has three parts:

- (1) All living things are composed of one or more cells.
- (2) Cells are the basic units of structure and function in an organism.
- (3) Cells come only from the reproduction of existing cells.

Read each question and write your answer in the space provided.

SKILL: Identifying Main Ideas

1. What caused scientists to discover the existence of cells?

2. What are the small rooms that monks lived in called?

3. What did Hooke observe in the cork slice?

Cell Theory Carol Hand,2018-12-15 The field of cell biology is built on a foundation of discoveries stretching back to the earliest descriptions of cell theory in the 1800s Today our growing insight into cells and their control of life functions continues to generate advances in areas such as medicine agriculture genetics and reproduction This book traces the rise of cell biology and explains biological concepts through easy to follow text Sidebars provide biographies of key scientists and descriptions of the evolution of microscopes and other significant technologies Readers travel deep inside the cell following the path of scientists as they unlock its mysteries **The Cell** Carl P. Swanson,Peter L. Webster,1977 *Molecules and Cells* D.A. Coult,1974 **The Cell: A Molecular Approach** Ray Arters, The cell stands as the fundamental unit of life representing the smallest organized structure that exhibits all the characteristics that define living systems This remarkable biological entity serves as both the building block from which all organisms are constructed and the basic functional unit that carries out the essential processes of life including metabolism growth reproduction and response to environmental stimuli The discovery and study of cells has revolutionized our understanding of biology revealing that despite the incredible diversity of life forms on Earth from microscopic bacteria to towering redwood trees and complex multicellular organisms like humans all share this common cellular foundation that unites all living things under a single theoretical framework The cell theory formulated in the nineteenth century through the pioneering work of Matthias Schleiden Theodor Schwann and Rudolf Virchow established three fundamental principles that remain central to modern biology First all living organisms are composed of one or more cells establishing the cell as the basic structural unit of life Second the cell is the basic functional unit of life meaning that all vital processes occur within cellular boundaries and depend on cellular mechanisms Third all cells arise from pre existing cells through cell division rejecting the notion of spontaneous generation and establishing the continuity of cellular life across generations The remarkable unity underlying cellular organization becomes apparent when examining the fundamental features shared by all cells regardless of their origin or complexity Every cell is bounded by a plasma membrane that separates the internal cellular environment from the external world while controlling the exchange of materials and information between these compartments This selective permeability enables cells to maintain distinct internal

conditions that are essential for proper cellular function while remaining responsive to environmental changes and signals

Function Joel D. Pardee, 2011 In this lecture, we will briefly review the principles of physics, central metabolism, and cell biology that make health possible. This exercise is appropriate for those of us who have set before ourselves the problem of understanding and preserving life processes because it is through the medium of a cell that energy creates life. We are aware that life processes require a complex set of biochemical reactions. But that is not enough. Not only are complex reactions necessary, but superimposed on this essential requirement is the necessity to build and maintain a dynamic cellular structure.

Chemical energy builds cells In this lecture we will see how cells extract energy from the entropic dissolution of the universe how the extracted energy is used to build cell structure and how cell structure determines cell function Table of Contents Origin and Energy of Life How Cells Make a Living Order From Chaos Entropy and The River of Time Capturing Entropy Cell Architecture Why Cells are Compartmentalized The Function of Organelles Cell Function The Secretory Pathway The Golgi Apparatus Mitochondria The Cytoskeleton How Organelles are Organized Vesicle Transport Mitosis Energy and Metabolism References

Cellular Structure and Function A. Malcolm Campbell, Christopher J. Paradise, 2016-03-24 All organisms are composed of cells but what is the definition of a cell Can size shape or function be used to distinguish cells from non living biological systems such as a virus Whatever the definition of a cell is it can probably be contradicted by cells with unusual characteristics For example there are cells as long as a giraffe's neck while others are smaller than a mitochondrion Sometimes it is hard to know the difference between an animal and a plant cell Despite their diversity of shapes and sizes cells are small most of the time Why has natural selection favored small cells Would it be possible for big organisms to have big cells It would seem safe to say viruses are small except some are quite large In the end this book will provide evidence that cells are difficult to characterize and define even though they are the foundation of all living things Cell Structure, Function and Metabolism Norman Cohen, 1991 Exploring how cell metabolism can be understood in terms of the structure and function of subcellular components this book describes the structure and function of the major cell organelles and moving further down in scale that of the main classes of biological macromolecules The key role of enzymes in facilitating metabolism is explored and finally there is an examination of the structure of the cell membrane **Biology Cell**
