Advanced Design and Manufacturing Based on STEP Xun Xu, Andrew Yeh Ching Nee, 2009-09-29 Design and manufacturing is the essential element in any product development lifecycle. Industry vendors and users have been seeking a common language to be used for the entire product development lifecycle that can describe design, manufacturing, and other data pertaining to the product. Many solutions were proposed, the most successful being the Standard for Exchange of Product model STEP. STEP provides a mechanism that is capable of describing product data independent from any particular system. The nature of this description makes it suitable not only for neutral file exchange but also as a basis for implementing sharing and archiving product databases. ISO 10303 AP203 is the first and perhaps the most successful AP developed to exchange design data between different CAD systems. Going from geometric data as in AP203 to features as in AP224 represents an important step towards having the right type of data in a STEP-based CAD/CAM system. Of particular significance is the publication of STEP NC as an extension of STEP to NC, utilising feature-based concepts for CNC machining purposes. The aim of this book is to provide a snapshot of the recent research outcomes and implementation cases in the field of design and manufacturing where STEP is used as the primary data representation protocol. The 20 chapters are contributed by authors from most of the top research teams in the world. These research teams are based in national research institutes, industries, as well as universities.

CGAL Arrangements and Their Applications Efi Fogel, Dan Halperin, Ron Wein, 2012-01-05 Arrangements of curves constitute fundamental structures that have been intensively studied in computational geometry. Arrangements have numerous applications in a wide range of areas; examples include geographic information systems, robot motion planning, statistics, computer-assisted surgery, and molecular biology. Implementing robust algorithms for arrangements is a notoriously difficult task, and the CGAL arrangements package is the first robust, comprehensive, generic, and efficient implementation of data structures and algorithms for arrangements of curves. This book is about how to use CGAL two-dimensional arrangements to solve problems. The authors first demonstrate the features of the

arrangement package and related packages using small example programs They then describe applications i e complete standalone programs written on top of CGAL arrangements used to solve meaningful problems for example finding the minimum area triangle defined by a set of points planning the motion of a polygon translating among polygons in the plane computing the offset polygon finding the largest common point sets under approximate congruence constructing the farthest point Voronoi diagram coordinating the motion of two discs moving among obstacles in the plane and performing Boolean operations on curved polygons The book contains comprehensive explanations of the solution programs many illustrations and detailed notes on further reading and it is supported by a website that contains downloadable software and exercises It will be suitable for graduate students and researchers involved in applied research in computational geometry and for professionals who require worked out solutions to real life geometric problems It is assumed that the reader is familiar with the C programming language and with the basics of the generic programming paradigm **The Ministers Manual** ,1962
