Integrated Optics H.-P. Nolting, R. Ulrich, 2013-06-05 The development of miniaturized and ruggedized optical circuits containing a number of optical and perhaps also electronic components integrated on the same substrate and performing useful optical functions this is the goal of the key technologies for future systems of communication of instrumentation and of general signal processing it is expected to combine and to complement the established technologies of microelectronics optoelectronics and fiber optics Today after more than fifteen years of research on integrated optics this goal appears to be almost within reach The theoretical problems of light propagation and of numerous forms of coupling and interactions in integrated optical structures are generally well understood A great variety of single components for integrated optics has been demonstrated experimentally and more recently also the successful integration of several components on a common substrate Laboratory operation of such integrated optical chips has been reported e.g. for RF spectrum analysis for high speed analog digital conversion for a fiber optic gyro and for various high performance semiconductor laser sources Before commercial fabrication and technical application of such devices can take place however their performance has to be further improved Serious technological and material problems are still to be overcome which are related to the small transverse dimensions and high optical power densities typical for integrated optical waveguides Progress can be expected here by further improvements and diversifications of micro fabrication technologies and perhaps more efficiently by learning how to better adapt the optical structures to the existing technologies
