

Unit 1-Overview: How the underlying biochemical structure works - Part 1

Phases of the DNA structure are as follows: 1. overall structure 2. sequence

- The gene is the fundamental unit of heredity
 - Each gene is composed of DNA sequences that specify the sequence of an amino acid
- DNA is composed of a very large molecule made by joining a series of repeating subunits
 - Each subunit is composed of a sugar and a phosphate group, which are linked

Structure

- Four types of bases are associated with the DNA structure: adenine, guanine, cytosine, thymine
 - adenine and guanine are purines
- The sugar-phosphate backbone is composed of a sugar and a phosphate group, which are linked together
 - adenine (purine) only with thymine (pyrimidine)
 - cytosine (pyrimidine) only with guanine (purine)
 - Only purines can be linked to adenine
 - The bases of the sugar-phosphate backbone are linked

Chemical Structure

- DNA stores the genetic information which are used by the cell to produce proteins
- The sequence of nitrogenous bases is a code for the production of proteins and enzymes (the products)
- Each gene is a sequence of DNA that codes for a particular protein
 - Example: the DNA sequence for the gene for the protein that codes for the enzyme
- The function of the gene is to produce a protein (the product) which is used by the cell to produce proteins and enzymes (the products)
- As a result, the protein will be used by the cell to produce proteins and enzymes
