

Student Exploration: Cell Energy Cycle

Activity A: Photosynthesis

Get the Gizmo ready:

- If necessary, click **Reset**.
- Check that the PHOTOSYNTHESIS tab is selected. Check that **Description** is turned on.

Introduction: Photosynthesis occurs in the **chloroplast**, an organelle found in plant and algae cells. Within the chloroplast, a green pigment called **chlorophyll** converts the **radiant energy** of sunlight into **chemical energy** that the plant can use.

Question: What are the inputs and outputs of photosynthesis?

1. **Predict:** Of the molecules shown on the MOLECULES pane, which do you think are inputs (ingredients) in photosynthesis? Which do you think are outputs?

Inputs: **Carbon dioxide, hydrogen, and sunlight**

Outputs: **Oxygen and glucose**

2. **Explore:** Drag each molecule from the MOLECULES pane to the chloroplast on the PHOTOSYNTHESIS pane. If a molecule is an input, it will stay in the chloroplast.

Which molecules are inputs in photosynthesis? **Carbon dioxide and hydrogen**

3. **Observe:** Click **Add light** and look at the **Output**. What are the outputs of photosynthesis?

Oxygen and glucose

4. **Summarize:** Although photosynthesis is a complex process involving many reactions, it can be summarized by a simplified formula that shows inputs on the left and outputs on the right. Based on your observations, write a simplified formula for photosynthesis:

Turn on **Show input/output formula** to check. Were you correct? **Yes**

5. **Challenge:** To balance the inputs and outputs of photosynthesis, there should be the same number of carbon, oxygen, and hydrogen atoms on each side of the arrow.

A. Is the formula balanced as written? Why or why not? **No, because there is different amounts of carbon dioxide, hydrogen, and oxygen.**

B. Now balance the input/output formula by adding coefficients to each molecule. Write the balanced formula below, and then check your work by clicking **Balance**.

Advanced Concepts in Photovoltaics Arthur J. Nozik, Gavin Conibeer, Matthew C Beard, 2014-07-10 Photovoltaic systems enable the sun's energy to be converted directly into electricity using semiconductor solar cells. The ultimate goal of photovoltaic research and development is to reduce the cost of solar power to reach or even become lower than the cost of electricity generated from fossil and nuclear fuels. The power conversion efficiency and the cost per unit area of the photovoltaic system are critical factors that determine the cost of photovoltaic electricity. Until recently, the power conversion efficiency of single junction photovoltaic cells has been limited to approximately 33%, the so-called Shockley-Queisser limit. This book presents the latest developments in photovoltaics which seek to either reach or surpass the Shockley-Queisser limit and to lower the cell cost per unit area. Progress toward this ultimate goal is presented for the three generations of photovoltaic cells: the 1st generation based on crystalline silicon semiconductors, the 2nd generation based on thin film silicon compound semiconductors, amorphous silicon and various mesoscopic structures, and the 3rd generation based on the unique properties of nanoscale materials, new inorganic and organic photoconversion materials, highly efficient multi-junction cells with low cost solar concentration and novel photovoltaic processes. The extent to which photovoltaic materials and processes can meet the expectations of efficient and cost-effective solar energy conversion to electricity is discussed. Written by an international team of expert contributors and with researchers in academia, national research laboratories and industry in mind, this book is a comprehensive guide to recent progress in photovoltaics and essential for any library or laboratory in the field.

Hydrogen and Fuel Cells Bent Sorensen, 2011-11-12 A hydrogen economy in which this one gas provides the source of all energy needs is often touted as the long-term solution to the environmental and security problems associated with fossil fuels. However, before hydrogen can be used as fuel on a global scale, we must establish cost-effective means of producing, storing and distributing the gas, develop cost-efficient technologies for converting hydrogen to electricity (e.g. fuel cells) and creating the infrastructure to support all this. Sorensen is the only text available that provides up-to-date coverage of all these issues at a level appropriate for the technical reader. The book not only describes the how and where aspects of hydrogen fuels, cells, usage but also the obstacles and benefits of its use as well as the social implications, both economically and environmentally. Written by a world-renowned researcher in energy systems, this thoroughly illustrated and cross-referenced book is an excellent reference for researchers, professionals and students in the field of renewable energy. Updated sections on PEM fuel cells, Molten carbonate cells, Solid Oxide cells and Biofuel cells. Updated material to reflect the growing commercial acceptance of stationary and portable fuel cell systems while also recognizing the ongoing research in automotive fuel cell systems. A new example of a regional system based on renewable energy sources reflects the growing international attention to uses of renewable energy as part of the energy grid. Examples of life cycle analysis of environmental and social impacts.
